
Your First C++ Program

Today

- In today's lecture we will
 - Write our first C++ program
 - Analyze the different components of C++ programs

Problem

- Programs are written to solve problems
- Imagine that you have been asked to solve the following problem
 - Your summer surveying job requires you to study some maps that give the distance in kilometers and some that use miles. You and your co-workers prefer to deal in metric measurements. Write a program that performs the necessary conversion

Your First C++ Program

```
1 //*****  
2 // File name: hello.cpp  
3 // Author: Shereen Khoja  
4 // Date: 08/23/2006  
5 // Purpose: This program displays a welcome message to  
6 // the user  
7 //*****  
8 #include <iostream>  
9 #include "stdafx.h"  
10  
11 using namespace std;  
12  
13 int main()  
14 {  
15     string name;  
16  
17     cout << "Type your name, then press enter" << endl;  
18  
19     cin >> name;  
20  
21     cout << "Hello " << name << "!" << endl;  
22  
23     return 0;  
24 }
```

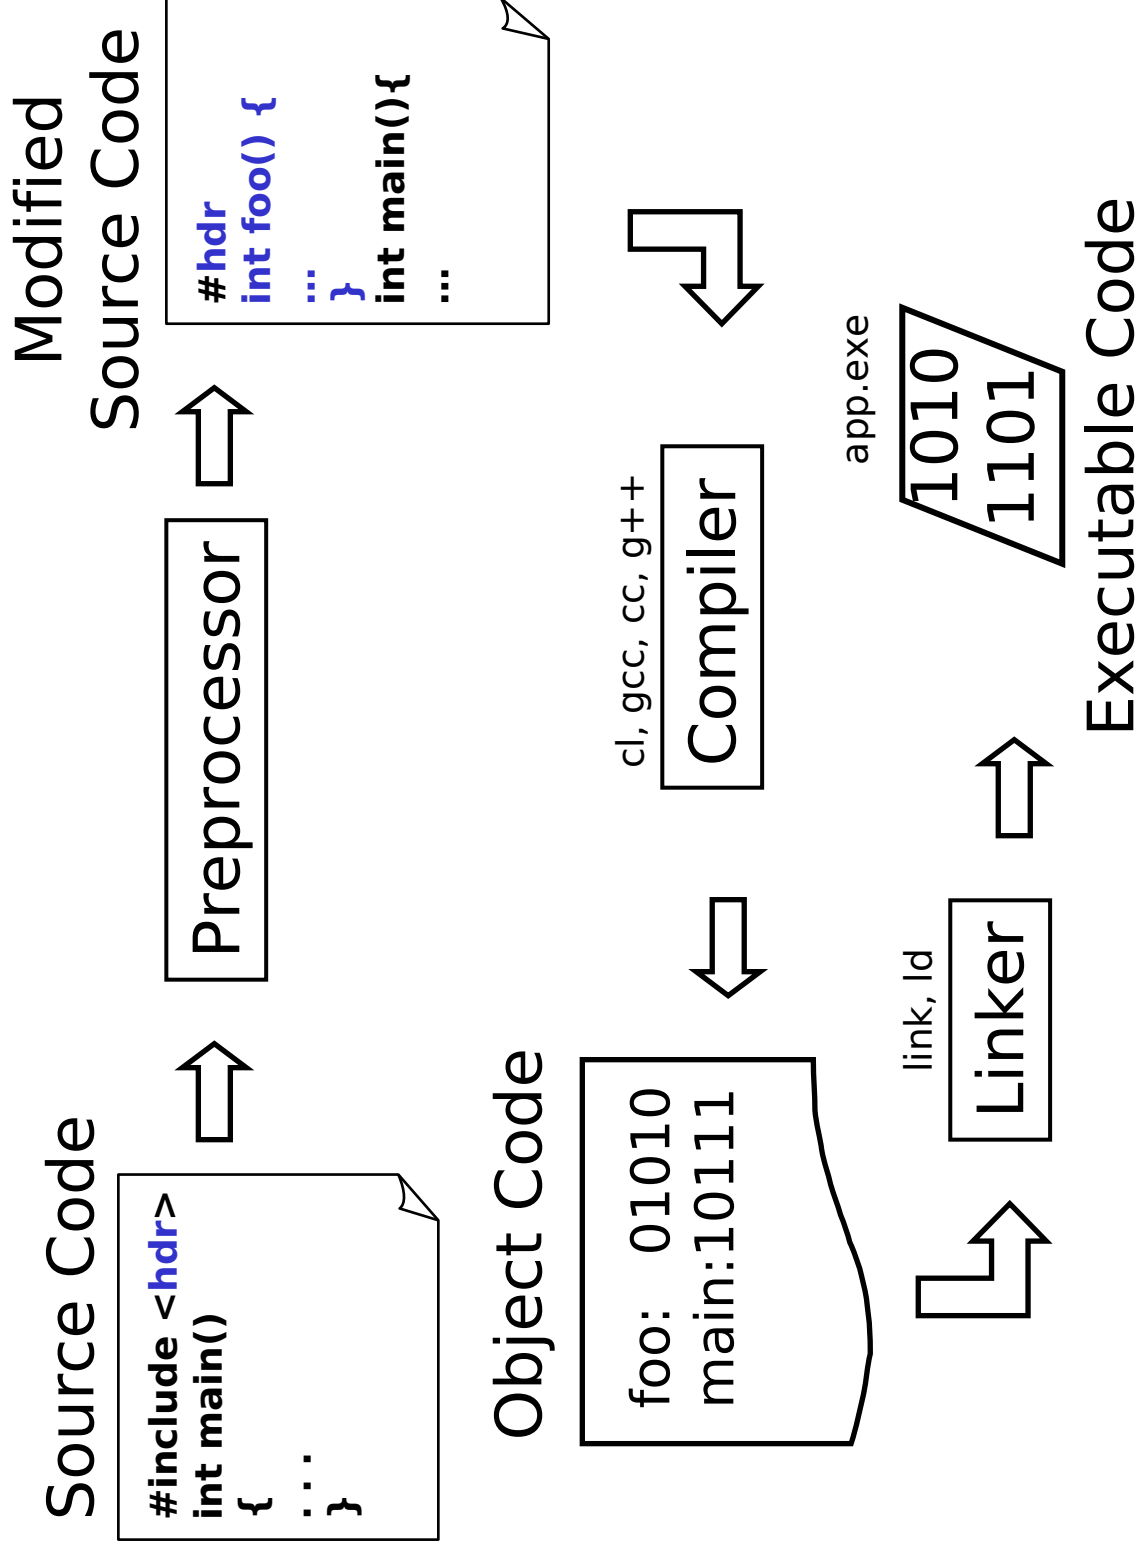

Program Output

Type your name, then press enter

Chadd

Hello Chadd!

Building an Application

Language Elements

- Key Words
 - Have special meaning in C++
 - `using`, `namespace`, `int`
- Programmer-Defined Identifiers
 - Names made up by the programmer
 - `name`
- Operators
 - Perform operations
 - `*`, `=`
- Punctuation
 - Used to mark the beginning and end of the program

Syntax

- Rules that must be followed when constructing a program
- Controls the use of key words, programmer-defined identifiers, operators, and punctuation

Variables

- Names storage location in the computers memory
- Holds data
- The data can change

Program Components

- The C++ program on the previous slide consists of the following elements:
 - Comments
 - Preprocessor directives
 - Standard namespace
 - `main` function
 - Declaration statements
 - Executable statements

Comments

- Comments are
 - How you explain in English what the different parts of your program do
 - Ignored by the compiler
 - Very important
- The editor in Visual Studio will colour code your comments. They will be green

Comments

- There are two ways to write comments
 - `// I am a comment`
 - Anything after `//` till the end of the line will be a comment
 - `/* I am another comment */`
 - You must start the comment with `/*` and end it with `*/` in this style of comment

Preprocessor directives

- `#include <iostream>`
- `#` signifies preprocessor directive
- Processed before program translation
- `#include` tells the preprocessor to look for libraries
- `<>` signifies part of standard C++ libraries
- We'll see other examples of preprocessor directives later

Preprocessor directives

- `iostream` is the input/output stream library
- It is needed to output data to the screen and read in data from the keyboard
- `#include` takes the contents of the library file and places them in the current program

Namespace std

- `using namespace std;`
- Indicates that we will be using objects (`cout` & `cin`) that are named in a region called `std`
- The statement ends in a semicolon
- The statement appears in all our programs

main Function

```
int main()  
{  
    // program statements  
    return 0;  
}
```

- Every program must have a main function
- It is where the start of your program execution begins
- `return 0;` ends the main function and indicates that the program terminated successfully
- Everything within the double braces `{ }` should be indented

Program Statements

- There are two types of statements that you can write inside the main (or any other) function
 - Declaration statements
 - Specify the data that is needed by the program
 - Executable statements
 - Perform operations
- All statements must end with a semicolon;

Program Statements

- Declaration statements
 - No declaration statements in our program
- Executable statements

```
cout << "Type your name, then press enter" << endl;
```

```
cin >> name;
```

```
cout << "Hello " << name << "!" << endl;
```

Program Skeleton

- All programs in C++ should have the following skeleton

```
/** *****  
// File name: filename.cpp  
// Author: Your Name  
// Date: 09/01/2004  
// Purpose: Description about what the program does  
/** *****  
#include <iostream>  
  
using namespace std;  
  
int main()  
{  
    // declaration statements  
  
    // executable statements  
  
    return 0;  
}
```

Summary

- Today we
 - Wrote our first C++ program
 - Introduced the basic components of a C++ program
- To see the program in action you should test it in Visual Studio .NET
- We covered p. 12 - 33 from your textbook
