CS150 Intro to CS I

Fall 2017

Chapter 4 Making Decisions

- Reading: Chapter 3 (3.5 pp. 101), Chapter 4 (4.4 pp. 166-168; 4.5 pp. 169-175; 4.6 pp.176-181; 4.8 pp. 182-189; 4.9 pp. 189-199; 4.14 pp. 202-210
- Good Problems to Work: pp. 104 [3.13]; pp. 166 [4.14]; pp. 175 [4.15]; p. 180 [4.16]; p 190 [4.19, 4.20]; pp.209-210 [4.27, 4.29, 4.30]

Explicit Type Conversion

- A type cast expression lets you manually change the data type of a value
- The syntax for type casting is

static_cast<DataType>(Value)

- Value is a variable or literal value
 - If Value is a variable, the variable is NOT changed.
- DataType is the data type that you are converting Value into

Example

```
double number = 3.7;
int val;
val = static_cast<int>(number);
```

What is saved into val?

if Statement

- We may want to execute some code if an expression is true, and execute some other code when the expression is false.
- This can be done with two if statements...

```
if (value >= LIMIT)
{
      // do something
}

if (value < LIMIT)
{
      // do something else
}</pre>
```

Double-Alternative if

C++ provides a shortcut to combine 2 if statements

```
if (expression)
{
    // stmts if expression is true
}
else
{
    // stmts if expression is false
}
```

```
int number;
cout << "Enter a number, I'll tell you";
cout << " if it is odd or even: ";
cin >> number;
// write a double-alternative if here
```

Are these two code snippets equivalent?

```
int x, y;
cin >> x >> y;
if(x > y)
{
   cout << x;
}
if(x < y)
{
   cout << y;
}</pre>
```

```
int x, y;
cin >> x >> y;
if(x > y)
{
   cout << x;
}
else
{
   cout << y;
}</pre>
```

Multiple-Alternative if

```
cout << "Enter two numbers: ";</pre>
cin >> num1 >> num2;
if (num1 > num2)
  cout << num1 << "is greater" << endl;</pre>
else if (num2 > num1)
  cout << num2 << "is greater" << endl;</pre>
else
  cout << "Numbers are equal" << endl;</pre>
```

- Write a C++ program segment that allows the user the ability to input an integer from the keyboard.
- If the integer is positive, increment a variable posCount by 1. If the integer is negative, increment a variable negCount by 1. If neither, increment zeroCount by 1

```
int posCount = 0,
  negCount = 0,
  zeroCount = 0;
```

Logical Operators

&& And

|| Or

! Not

Evaluating AND

expr1 && expr2

- For the complete expression to be true, both expr1 and expr2 must be true
- Example:

```
(temp > HOT) && (humidity > STICKY)
```

- > These are unbearable heat and humidity conditions
- > Both must be true for the entire expression to be true

Evaluating OR

expr1 || expr2

- The complete expression is true, if either expr1 or expr2 is true
- Example:

```
(salary < MIN_SALARY) || (MARRIED == status)</pre>
```

- To qualify for financial aid, salary has to be less than some minimum salary OR you must be married
- > Only one condition has to be true

Evaluating NOT

!expr

- If expr is true, !expr is false
- If expr is false, !expr is true
- Example:
- ! (salary < MIN_SALARY)</pre>
 - What makes this true? False?

Operator Precedence (highest to lowest)

Unary plus & minus	+ -!	Right associative
Multiplication, division, and modulus	* / %	Left associative
Addition & subtraction	+ -	Left associative
Relational operators	< <= >>=	Left associative
Relational operators	== !=	Left associative
Logical AND	&&	Left associative
Logical OR	II	Left associative
Assignment	=	Right associative

 According to the operator precedence and associativity rules given on the previous slide, how will the following expressions be evaluated?

```
x < min + max
min <= x && x <= max
!x == y + 2
x = a + b % 7 * 2</pre>
```

 Write a program segment that prints the message "The number is valid" if the variable speed is within the range 0-20 inclusive

You must use logical operators

- A bookstore's shipping policy is:
 - 1. If the order is \$30 or less, shipping is \$5
 - 2. If the order is over \$30 but less than \$50, shipping is \$3
 - 3. If the order is \$50 or more then shipping is \$2
 - Rewrite this program using logical operators

switch statement

• Let's look at the following program segment:

```
char choice;

cout << "E)dit S)ave Q)uit";
cin >> choice;

switch (choice)
{
   case 'E': cout << "Time to edit " << endl;
        break;
   case 'S': cout << "Time to save" << endl;
        break;
   default: cout << "Illegal command" << endl;
}</pre>
```

19

switch format

What is an ordinal data type?

- (ordinaldatatype) can be a variable or expression
- constantexpression must be unique in each case
- default is optional
- break; resumes execution after the switch

1. Modify slide 20 to allow 'E', 'e', 'S', or 's'

2. Rewrite the logic for 1. as an if statement
