Practice

- Write a function that will turn a numeric character into that character's integer value

- For example
  - When a **'0'** is given, a **0** is returned.
  - When a **'5'** is given, a **5** is returned.

- If a non-numeric character is given, just return -1

- What parameters do you need?

- What should the return type by?

- Write code in main() to test your function.
