## Decidability

Section 4.1/4.2

November 14, 2014

# Decidability

- “the power of algorithms to solve problems.” p 165
- What are the limits of algorithmic solvability?
- How can we tell if two Regular Expressions define the same language?
  - or, can we?
- A language is **decidable** if some TM **decides** it

# Decidable

- Take a question
  - turn it into a language where answer is yes
    - accept: yes
    - reject: no
  - encode in a string
  - build TM
  - If always halts: decidable!

# Decidable? Recognizable?

- $\{ x \mid x \text{ is prime, } y \text{ is prime, } x \text{ is a substring of } y, x \in \{0..9\}^+, y \in \{0..9\}^+ \}$
- $\{ x \mid x \text{ is prime, } y \text{ is prime, } x \text{ is a } \textit{proper} \text{ substring of } y, x \in \{0..9\}^+, y \in \{0..9\}^+ \}$
- $\{ y \mid x \text{ is prime, } y \text{ is prime, } x \text{ is a proper substring of } y, x \in \{0..9\}^+, y \in \{0..9\}^+ \}$

# Decidability

- Acceptance Problem (DFA): Does a given DFA,  $B$ , accept a given string  $w$ ?
- In terms of languages (because we have defined computation as accept/reject a language):
  - $A_{\text{DFA}} = \{ \langle B, w \rangle \mid B \text{ is a DFA that accepts } w \}$
  - For ALL input pairs  $\langle B, w \rangle$  can a single TM be constructed that will decide  $\langle B, w \rangle \in A_{\text{DFA}}$ 
    - can we build one TM that will work for all DFAs?
    - is there an **algorithmic** way to solve this problem?

# Theorem

- $A_{\text{DFA}}$  is decidable
  - given  $\langle B, w \rangle$  we can decide if  $\langle B, w \rangle \in A_{\text{DFA}}$  or  $\langle B, w \rangle \notin A_{\text{DFA}}$
- Proof Idea:
  - Use a TM,  $M$ , to simulate  $B$  with input  $w$
  - Keep track of current state and current position on the input string
  - Update according to the DFA's  $\delta$

# Also...

- $A_{\text{NFA}}$  and  $A_{\text{Regular Expression}}$  are also decidable
  - why?

# Emptiness testing

- Does a finite automata accept any strings at all?
  - $E_{\text{DFA}} = \{ \langle A \rangle \mid A \text{ is a DFA and } L(A) = \emptyset \}$
- Theorem:  $E_{\text{DFA}}$  is decidable
- Proof Idea:
  - is it possible to reach an accept state from  $q_0$ ?

# Equivalence testing

- Do two DFAs recognize the same language?
  - $EQ_{DFA} = \{ \langle A, B \rangle \mid A \text{ and } B \text{ are DFAs and } L(A) = L(B) \}$
- Theorem:  $EQ_{DFA}$  is decidable
  - Proof:

# Question

- Can we tell if two Regular Expressions define the same

language?

– why or why not?

# CFGs

- $A_{\text{CFG}} = \{ \langle G, w \rangle \mid G \text{ is a CFG that generates } w \}$
- $A_{\text{CFG}}$  is decidable
- Could enumerate all strings produced by  $G$ : could be **infinite**, though
- Proof Idea

# Equivalence of CFGs

- $EQ_{CFG} = \{ \langle G, H \rangle \mid G \text{ and } H \text{ are CFL and } L(G) = L(H) \}$ 
  - not decidable
