

CS 485  
Advanced Object Oriented Design

Dynamic Memory

Spring 2019

# pointers! new/delete

- Dynamic memory

Don't use  
malloc/free  
in C++

- Design Techniques

- RAII

- resource acquisition is initialization

- constructor/destructor

- CopyAndSwap

# const

```
const int * pData;
```

```
int const * pData;
```

```
int * const pData;
```

```
const int * const pData;
```

```
int const * const *pData;
```

const applies to the type to the immediate left, however you can put const as the left most token and then it applies to the immediate right.

<http://c-faq.com/decl/spiral.anderson.html>

# NULL vs nullptr

- NULL is really an int
- nullptr is its own type (std::nullptr\_t)

```
void foo(int *ptr);  
void foo(int data);
```

```
foo(NULL); // who gets called?  
foo(nullptr); // who gets called?
```

```
auto ptr = NULL;  
auto ptr2 = nullptr;
```

```
cout << typeid(ptr).name();  
cout << typeid(ptr2).name();
```

various new C++11 std:: functions take only nullptr

legacy C code may not work with nullptr!

<https://en.cppreference.com/w/cpp/language/typeid>  
[https://en.cppreference.com/w/cpp/types/type\\_info](https://en.cppreference.com/w/cpp/types/type_info)  
[https://en.cppreference.com/w/cpp/types/nullptr\\_t](https://en.cppreference.com/w/cpp/types/nullptr_t)

# Classes that contain dynamic memory

- Or any dynamic resource (file, network, ...)

```
class bigData
{
    public:

        bigData();
        bigData(int data);
        ~bigData();
        bigData(const bigData &rcData);

        // bigData& operator=(const bigData &rcData);

        // you cannot declare both operator= at the same time!
        bigData& operator=(bigData cData); //force copy constructor to be called

    private:
        int *mpHugeData = nullptr;
}
```

# copy-and-swap

```
bigData::bigData(const bigData &rcData)
{
    // let's assume this is written and works correctly
}

bigData& bigData::operator=(bigData cData)
{
    // what happens when cBigData1 = cBigData2; is executed?

    // what happens when operator= terminates?
}
```

- What gets called? How many objects are created?

```
bigData cBigData (1);  
bigData cBigData2 (cBigData);  
bigData cBigData3 ;
```

```
cBigData3 = cBigData2;
```

ctor, cctor, dtor?

# Smart Pointers

- C++11 wrapper classes to manage pointers
  - RAII for pointers
  - `<memory>`
- `unique_ptr`
- `shared_ptr`
- `weak_ptr`

<https://msdn.microsoft.com/en-us/library/hh279674.aspx>

[http://umich.edu/~eecs381/handouts/C++11\\_smart\\_ptrs.pdf](http://umich.edu/~eecs381/handouts/C++11_smart_ptrs.pdf)

# raw pointer

- `int *pRawPointer;`
- Issues:

# std::unique\_ptr

```
std::unique_ptr<bigData> pBigData(new bigData(42));
```

```
auto pBigDataAgain(std::make_unique<bigData>(bigData(41)));
```

# std::shared\_ptr

```
std::shared_ptr<bigData> pBigDataShared(new bigData(7));  
  
auto pBigDataSecondShared = pBigDataShared;  
  
auto pBigDataSharedAgain (std::make_shared<bigData> (bigData (41)));
```

# Lab - use raw pointers

- You must write your own string class, backed by a dynamic char array.
- The string class must implement the interface provided.
  - PacString.h
- Use the provided test driver. main.cpp
  - make sure there are no memory leaks
  - determine how many times each of the following is called by the test driver:
    - default constructor
    - constructor (const char \*)
    - copy constructor
    - destructor

# Visual Leak Detector
