

CS150 Exam #3 Review Topics

1. Nested Loops

Write a nested loop that asks the user to enter a value between 1 and 10. Print the following pattern based on the user's input.

```
1  
22  
333  
4444  
...  
...
```

2. Functions

- a. Why use functions?
- b. Function prototype versus function definition
- c. Function arguments versus function parameters
- d. Pass by value versus pass by reference
- e. Function body
- f. Scope of a variable
- g. Rules for parameter lists and passing arguments to functions

3. What is the output?

```
void changeIt (int &i, int j, int &k)  
{  
    ++i;  
    k = i + j++;  
}  
int main ()  
{  
    int i = 1, j = 2, k = 3;  
    changeIt (i, j, k);  
    cout << i << j << k << endl;  
    changeIt (k, i, j);  
    cout << i << j << k << endl;  
    changeIt (i, i, i);  
    cout << i << endl;  
    return EXIT_SUCCESS;  
}
```

4. Arrays

- a. Declaration
- b. index
- c. element
- d. bounds checking

- e. initializer list
 - f. implicit versus explicit array sizing
 - g. parallel arrays
 - h. passing arrays and regular variables to functions
 - i. How are arrays passed ... by value or reference?
5. Problem (Easy):
- a. Write a function **switchIt** that accepts an integer array and the number of elements in the array.
 - b. Switch the first and last values in the array. For example, if the array is int values[] = {1,2,3,4}, then after calling switchIt, the array would be 4, 2, 3, 1.
 - c. Show what a call to your function would look like.
6. Problem (Hard):
- a. Write a bool function **containsDuplicates** that accepts an integer array and the number of elements in the array.
 - b. Return true if there are duplicates in the array; otherwise, return false
 - c. Show what a call to your function would look like.
7. Problem: A data file students.txt exists containing the following student information:
- lastName firstName age gender**
- Assuming an unknown number of students exist (but at most 100), write a C++ program that:
- a) reads in all student information into parallel arrays by calling a function **readStudentData**
 - b) prints the average of all students ... call **computeAvgAge** from the main function
 - c) prints all students of a particular gender ... call a **functionprintStudentGender** to do this
8. Help videos:
- a. Functions:
<http://zeus.cs.pacificu.edu/PacificCSVideos/c++/functions.html>
 - b. Arrays:
<http://zeus.cs.pacificu.edu/PacificCSVideos/c++/array1d.html>
