CS 150 Lab 5
Complex Conditional Logic

The main objective of today’s lab is to solve a problem that uses complex conditional logic including relational operators, logical operators, modulus, single-alternative ifs, double-alternative ifs, and multiple-alternative ifs. You are to continue using the Visual Studio debugger to help identify any logical errors that your program contains.

1. Be sure your output looks exactly like the specified output.
2. Submit your solutions folder with the completed project to CS150-01 Drop folder when you are done.
3. Use the program skeleton and add comments to your code.
4. Write small pieces of code and test as you go!!!!!!!!!!!
5. Show the instructor or TA after completing even/odd, then prime, and finally sum of digits.

Lab 5.1

Write a complete C++ program in a project called 05_1_Calculator that implements a simple calculator. The operators are +, -, *, and / Any other operator is invalid. You must use a switch statement to carry out the operation. Here is how your program is to work.

Lab 5.2

Add a project called 05_2_FunWithNumbers to your PUNetIDLabs solution that solves the following problem.

Write a complete C++ program that allows the user the ability to enter a number in the range of some
lower bound (minimum 2) to some upper bound (maximum 100). These are integers and are initially set to 2 and 100. You are then to ask the user to enter a value and print out whether the value entered is even or odd, prime or not, and finally the sum of the digits.

Here is how your program is to work:

1. Your programs are to compile without any errors or warnings.

2. You might find the Web site www4.ncsu.edu/~ahjones3/courses/PrimeFactorization.pdf useful for information on primes.

Once your projects are complete, place your solution PUNetIDLabs into the **CS150-01 Drop** folder on grace. Your solution is to have all previous projects completely working and correct.
