# CS150 Intro to CS I

#### Fall 2014

## Chapter 6 Functions

- Reading: pp. 324-334, 348-354
- Good Problems to Work: p. 334 [6.11, 6.14]; p. 353 [6.23]; p. 363 [1 7] important; p 366 [56, 57]

## Functions calling other functions

- Write a complete C++ program that allows the user the ability to enter the numerator and denominator of a fraction. Print the fraction and the reduced fraction.
- The C++ driver for this problem is on the next slide.
- You are to write each of the function definitions for each of the function prototypes.
- You will have functions calling other functions!!!!!

#### **Reduced Fraction Driver**

```
void printFraction (int, int);
int minimum (int, int);
int getPositiveInt ();
int greatestCommonDivisor (int, int);
void printFractionReduced (int, int);
int main ()
{
  int numerator, denominator;
  numerator = getPositiveInt ();
  denominator = getPositiveInt ();
  printFraction (numerator, denominator);
  cout << " reduced is ";</pre>
  printFractionReduced (numerator, denominator);
  cout << endl << endl;</pre>
  return EXIT SUCCESS;
all 2014
                                CS150 - Intro to CS I
```

## **Passing Arguments**

- Pass by value
  - > arguments are **copied** into the parameter list
  - changes made in the function will **not** be reflected in the calling function
- Pass by reference
  - changes made in the function are reflected in the calling function

#### Example

#include <iostream>

```
using namespace std;
void ValTest (int parm1, int parm2)
{
 parm1 = 33;
 parm2 = 44;
}
void RefTest (int &parm1, int &parm2)
{
 parm1 = 77;
 parm2 = 88;
}
int main ()
ł
 int val1 = 0, val2 = 0, val3 = 0, val4 = 0;
 ValTest (val1, val2);
 cout << "val1 = " << val1 << ", val2 = " << val2 << endl;</pre>
 RefTest (val3, val4);
 cout << "val3 = " << val3 << ", val4 = " << val4 << endl;</pre>
 return EXIT_SUCCESS;
}
```

### Example

```
void swap (int &num1, int &num2);
int main ()
{
  int i, j;
  cin >> i >> j;
  swap (i,j);
  cout << i << j;
  return EXIT SUCCESS;
}
void swap (int &num1, int &num2)
{
  int temp;
  temp = num1;
  num1 = num2;
  num2 = temp;
  return;
}
           CS150 - Intro to CS I
```

## Practice What is the output?

<pre>void changeIt (int, int&amp;, int&amp;); int main () {</pre>	<pre>void changeIt (int j,</pre>
<pre>int i, j, k, l;</pre>	{
i = 2;	
j = 3;	i++;
k = 4;	j += 2;
1 = 5;	
changeIt (i, j, k);	1 += 1;
cout << i << j << k << endl;	}
<pre>changeIt (k, l, i);</pre>	
cout << i << k << l << endl;	
<pre>return EXIT_SUCCESS;</pre>	
}	

### **Rules for Parameter Lists**

- Same number of arguments as parameters
- Arguments & parameters are matched by position
- Arguments & parameters are matched by type
- The names of the arguments and parameters may be the same or different
- For reference parameters only, the parameter must be a single, simple variable

#### Practice

```
    Given the following function prototype:

  void checkIt (float &, float &, int, int, char &);
And declarations in main:
  float x, y;
   int m;
  char next;
Which are legal?
  checkIt (x, y, m+3, 10, next);
  checkIt (m, x, 30, 10, 'c');
  checkIt (x, y, m, 10);
  checkIt (35.0, y, m, 12, next);
  checkIt (x, y, m, m, c);
```

#### Practice

- Write a function to calculate the area of a rectangle. This function should produce a value and return it to the calling function.
- Write another function to calculate the area of a circle.
  - > What data type should each function return?
  - > What parameters should each function accept?

#### Practice

- Build a small program that asks the user for either a rectangle or circle and displays the area of the selection shape. Use the functions we just defined.
- Continue asking for input until the user types an 'r' or 'c'.
- The main function should be small and mostly function calls. Is this true of your main? Is an additional function needed?
