Assignment #5

Topic(s):       Dynamic List ADT Implementation
Date assigned:  Tuesday, October 27, 2009
Date due:       Tuesday, November 10, 2009
Points:         50 pts

For this assignment, you are to create another project called dynamiclist and
implement the List ADT below as a dynamic (all nodes added to the list are to be
done using malloc) singly linked list in a file called list.c using the
header file list.h. All of the data structures and function prototypes
are defined in list.h. Further, each function prototype has been described to
the point that you should be able to implement each list function in the file
list.c. Make sure you have completely tested and debugged each operation.

Notes:

1) Create a C project called DynamicList in Eclipse 3.5.

2) The DynamicList project is to have the following folders:
   a) Headers
   b) Sources
   c) Includes
   d) Binaries
   e) Testcases
   f) Tarfiles

3) Create a makefile at the same level as the folders in 2

4) In the Sources folder, create a driver called dynamiclistdriver.c. You are
   to use the same code from staticlistdriver.c to test your dynamiclistdriver
   module.

5) Submit a zipped up tarfile called 05yourlastname.tar.gz, using the submit
   script, which contains your entire project.

6) Using the color printer (double-sided and stapled), print your source code in
   the following order:
   a) The driver dynamiclistdriver.c you used to test your program
   b) list.h
   c) list.c
   d) the makefile

7) Do not make any changes to list.h unless we all agree on the changes at
   which time I will post the new list.h file on zeus.

8) Anything that returns a ListElement *, make sure to set psNext to NULL as
   we don't want the user to have access to the list.

Topic(s):       Dynamic List ADT Implementation (Optional)
Date assigned:  Tuesday, October 27, 2009
Date due:       Tuesday, November 10, 2009
Points:         25 pts

1) Incorporate your new dynamic list module into the InfixToPostfix assignment.
   You should not use any of the static list module in the InfixToPostfix
   solution. For those of you who have a working InfixToPostfix  module this
   will be easy. For those of you who don't, this will take more time.
```

```
8) Let's take a look at list.h

 */

/*****************************************************************************
 File name:      list.h (Version 3.0)
 Author:         Doug Ryan
 Date:           9/20/09
 Class:          CS300
 Assignment:     List Implementation
 Purpose:        This file defines the constants, data structures, and function
                 prototypes for implementing a list data structure. In essence,
                 the list API is defined for other modules.

 Modifications: 1) Reorganized function prototypes into related sections to make
                   more readable. 10/2/09
                 2) Corrected ADT specification errors 10/2/09
                 3) Added union 10/7/09
                 4) Modified to work with dynamically allocated singly linked
                    lists 10/27

/*
 * Specification: List
 *
 * Elements:    The elements are of type ListElement
 *
 * Structure:   There is a linear relationship among the elements. That is,
 *              each list element has a unique predecessor and a unique
 *              successor except the first and last elements. Each element
 *              has a unique position which for the array implementation
 *              will be position 0, 1, ... Given an element at position
 *              k, then the element at position k - 1 is the predecessor and
 *              the element at k + 1 is the successor.
 *
 * Domain:      The number of elements in the domain is bounded
 *
 * Operations:  The following operations are defined and are to be implemented
 *              in list.c
