

Methods

"Form Ever Follows Function"
Louis Henri Sullivan

2/9/04 CS360 Client/Server Programming Using Java 1

Purpose of Methods

- ❖ Why do you think it is important for us to use methods?
- ❖ What things do we need to know about methods before we can use them?

2/9/04 CS360 Client/Server Programming Using Java 2

Modularity

- ❖ Modularity is achieved in Java in two ways
 - > Classes
 - > Methods

2/9/04 CS360 Client/Server Programming Using Java 3

Java API

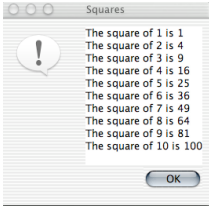

- ❖ Math class
- ❖ One of the most useful Java classes
- ❖ `Math.sqrt(900.0);`
- ❖ `Math.PI`
- ❖ `Math.E`

2/9/04 CS360 Client/Server Programming Using Java 4

Example

- ❖ Write a Java application that will display the squares of the first ten integers starting from 1.

2/9/04 CS360 Client/Server Programming Using Java 5

Squares Program

```

public class SquareIntegers
{
    public static void main( String args[] )
    {
        JTextArea outputArea = new JTextArea ( );

        int result;
        String output = "";

        for( int i=1; i<=10; i++)
        {
            result = square( i );
            output += "The square of " + i + " is " + result + "\n";
        }
    }
  
```

2/9/04 CS360 Client/Server Programming Using Java 6

Squares Program

```
outputArea.setText( output );

JOptionPane.showMessageDialog( null, outputArea,
    "Squares", JOptionPane.INFORMATION_MESSAGE );

} //end main

public static int square( int y )
{
    return y*y;
} //end square
} //end class
```

2/9/04

CS360 Client/Server
Programming Using Java

7

Calling Methods

- ❖ There are several ways to call methods
 - Just use the method name
 - ✓ `square(i)`
 - Use an objects followed by `.` and method name
 - ✓ `outputArea.setText(output);`
 - Use the class name to qualify the method
 - ✓ `JOptionPane.showMessageDialog(...)`
 - ✓ Only works with static methods

2/9/04

CS360 Client/Server
Programming Using Java

8

Properties of Methods

- ❖ Method header
 - `Return_value Method_name(argument1, argument2)`
- ❖ Method body
 - `{ declarations, statements }`
- ❖ A method cannot be declared inside another method

2/9/04

CS360 Client/Server
Programming Using Java

9

Argument Promotion

- ❖ Applies to Java primitive types
- ❖ Primitive data types can be promoted to other data types
 - Similar to type casting in C++
- ❖ What problems can you see with this?

2/9/04

CS360 Client/Server
Programming Using Java

10

Promotion Rules

| | |
|---------|-----------------------------------|
| double | none |
| float | double |
| long | float or double |
| int | long, float or double |
| char | int, long, float or double |
| short | int, long, float or double |
| byte | short, int, long, float or double |
| boolean | none |

2/9/04

CS360 Client/Server
Programming Using Java

11

Type Casting

- ❖ What would happen if we tried to force a promotion from a higher data type (`double`) to a lower data type (`int`)?
- ❖ For example, what would happen if we added the following statements to our squares program:
 - `result = square(9.5);`
 - `output += result;`

2/9/04

CS360 Client/Server
Programming Using Java

12

Type Casting

❖ The compiler throws an error:
`SquareIntegers.java:18: square(int) in SquareIntegers
cannot be applied to (double)
result = square(9.5);
 ^`

❖ We must force the type casting
`result = square((int) 9.8);
output += "The square of 9.8 is " + result
+ "\n";`

2/9/04

CS360 Client/Server
Programming Using Java

13

GUI

❖ A GUI presents a user-friendly mechanism for interacting with a program

❖ GUI's are built from GUI components
 > Controls or widgets

❖ Examples of widgets:

- > JTextArea
- > JTextField
- > JLabel
- > JButton

2/9/04

CS360 Client/Server
Programming Using Java

14

GUI

❖ So far we have

- > Displayed messages in dialog boxes
 - ✓ `JOptionPane.showMessageDialog(null, "Message", "Title", JOptionPane.INFORMATION_MESSAGE);`
- > Receive input from the user through a dialog box
 - ✓ `JOptionPane.showInputDialog("Enter Number");`
- > Added a widget to a dialog box
 - ✓ `JOptionPane.showMessageDialog(null, widget, "title", JOptionPane.INFORMATION_MESSAGE);`

2/9/04

CS360 Client/Server
Programming Using Java

15

GUI

❖ GUI widgets can be placed in their own window
 > Not using dialog boxes

❖ To do this in applets, widgets need to be placed on to the onscreen display area
 > Called the content pane

❖ The location where the widgets get placed depends on the layout manager

2/9/04

CS360 Client/Server
Programming Using Java

16

Layout Managers

❖ Programmer can specify where the widget is going to appear on the window using the X and Y coordinates

❖ Use layout manager:

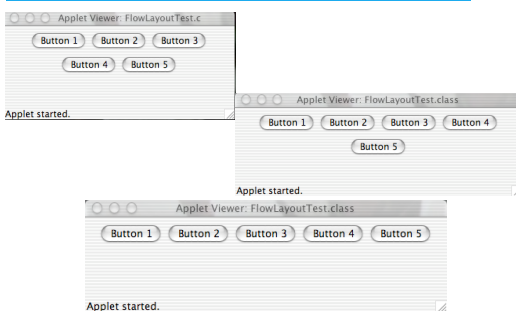

- > FlowLayout
 - ✓ Widgets added sequentially, left to right
- > BorderLayout
 - ✓ Widgets are added to NORTH, SOUTH, EAST, WEST or CENTER
- > GridLayout
 - ✓ Arranges components into rows and columns

2/9/04

CS360 Client/Server
Programming Using Java

17

FlowLayout

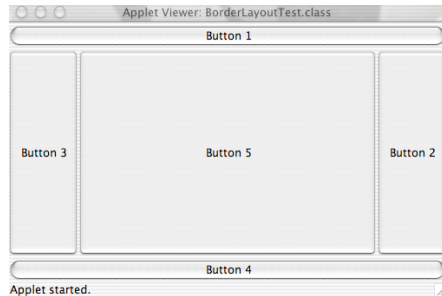

2/9/04

CS360 Client/Server
Programming Using Java

18

BorderLayout

2/9/04

CS360 Client/Server
Programming Using Java

19

GridLayout

- ❖ 2 rows, 3 columns

2/9/04

CS360 Client/Server
Programming Using Java

20

Constants

- ❖ Constants are declared in Java using the keyword **final**
- ❖ `final int WON = 0, LOST = 1, CONTINUE = 2;`

2/9/04

CS360 Client/Server
Programming Using Java

21

Event Handling

- ❖ To handle user interaction with the GUI, Java programs must contain the necessary event handling code
- ❖ Event handling is performed by
 - Implementing the interface `ActionListener`
 - ✓ `public class BorderLayoutTest extends JApplet implements ActionListener { }`
 - Adding the method `ActionPerformed`
 - ✓ `public void actionPerformed(ActionEvent actionEvent) { }`

2/9/04

CS360 Client/Server
Programming Using Java

22

Event Handling

- ❖ We need to also import the necessary classes
 - `import java.awt.event.*;`
- ❖ Add an action listener to each widget that accepts an event from the user
 - `button1.addActionListener(this);`

2/9/04

CS360 Client/Server
Programming Using Java

23

Event Handling Program

2/9/04

CS360 Client/Server
Programming Using Java

24

Multiplication Program

- ❖ Write a program that will assist children in learning multiplication of single digit numbers. Your program should display a text label asking the children the question, a text field for the user to enter the result, a button to submit the answer and a label displaying if the answer was correct or incorrect
- ❖ If the answer was incorrect, the user should be asked the same question again, otherwise the numbers change

2/9/04

CS360 Client/Server
Programming Using Java

25

Multiplication Program

- ❖ The message displayed after the user has submitted an answer should randomly choose from a list of different messages, so that the user doesn't get bored

2/9/04

CS360 Client/Server
Programming Using Java

26

Fields

- ❖ Fields are variables that have been declared inside a class but outside of any method
- ❖ These fields are accessible to all methods
- ❖ Called *instance variables* in other programming languages

2/9/04

CS360 Client/Server
Programming Using Java

27

Scope of Declarations

- ❖ The scope of a parameter declaration is the body of the method in which the declaration appears
- ❖ The scope of a local variable declaration is from the point at which the declaration appears in the block to the end of that block
- ❖ The scope of a local variable declaration that appears in the initialisation of a **for** statement's header is the body of the **for** statement

2/9/04

CS360 Client/Server
Programming Using Java

28

Scope of Declarations

- ❖ The scope of a method or field of a class is the entire body of the class
- ❖ If a local variable or parameter in a method has the same name as a field, the field is "hidden" until the block terminates executing
- ❖ This is called shadowing

2/9/04

CS360 Client/Server
Programming Using Java

29

What is the Output?

2/9/04

CS360 Client/Server
Programming Using Java

30

Method Overloading

❖ Several methods of the same name can be declared in the same class as long as they have different parameters

❖ This is called method overloading

❖ Example:

```
> Public int square( int x ) { }  
> Public double square( double x ) { }
```

Summary

❖ Today we covered:

- Random numbers
- GUI components
- GUI layout managers
- Event handling
- Scope of declaration
- Method overloading

❖ Reading:

- Today we covered Chapter 6 up till 6.12
- Remainder of chapter 6 covers recursion (not required)
- So far we have completed chapters 1 through 7
- Next time we will start on object based programming (chapter 8)
