

CS121: Our Digital World

Encryption

+ Encryption

- The art of encoding messages so they can't be understood by eavesdroppers or adversaries into whose hands the messages might fall.
- Decoding requires knowing the "key" that was used to encrypt it.

+ Security

- On the one hand, electronic commerce requires encryption so that businesses and their customers can complete transactions in a secure manner
- On the other hand it is important to prevent secret communication among outlaws

+ Question

- How can private data, such as credit card numbers, be transmitted online securely?
- Public-key cryptography!

+ History

- Cipher: A method for transforming a message into an obscured form
- Caesar Cipher:
 - Shift forward n letters
 - For example, shift forward 3 letters:
 - A->D, B->E, ..., Z->C
 - This is a Caesar cipher using a key of 3
 - MESSAGE -> PHVVDJH

+ Caesar Cipher

- Decode the following encoded message:
- DEEDUSEKBTFEIIYRBOTUSETUJXYI

■ What would you do?

Substitution Cipher

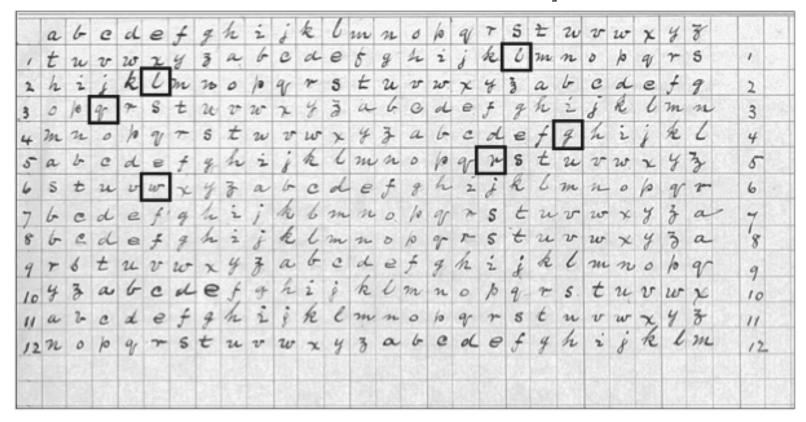

- The Caesar cipher is an example of a substitution cipher
- Instead of shifting letters, you could substitute randomly
 - ABCDEFGHIJKLMNOPQRSTUVWXYZ
 - XAPZRDWIBMQEOFTYCGSHULJVKN
- How many possible substitutions are there?
- 26 x 25 x 24 x ... x 3 x 2
- 4 x 10²⁶ different methods
- How secure is that!

*Breaking Substitution Ciphers

■ How can substitution ciphers be broken?

Vigenère Cipher

- Created in the 19th century
- Considered unbreakable for hundreds of years

+ Vigenère Grid

+ Vigenère Cipher

■ Plaintext: ROME IS THE GREATEST EMPIRE

■ Keyword: MATH

- How would you use the Vigenère Grid to encode the plaintext message?
- How would you decode the message?

+ Vigenère Cipher

- If you don't know the key, how would you decrypt the message?
- What makes a good key?
- How do you get the secret key to the receiver?

■ Vigenère Cipher was broken by Charles Babbage in the 1800's

+ The Key Problem

- Keeping the key secret is of utmost priority
- How can you secure the key in the age of the Internet?
