
Combined Assignments, Relational Operators, and the If Statement

9/15/06

CS150 Introduction to Computer Science 1

1

Multiple Assignments (3.7)

- C++ allows statements such as:

```
a = b = c = d = 45;
```

- Why do you think that is?
- What is the associativity of the assignment operator?

9/15/06

CS150 Introduction to Computer Science 1

2

Combined Assignments

- The same variable can be used on the left hand side of the assignment and on the right hand side

```
notes = notes / 20;
```

```
note = notes % 20;
```

- These are common in programming, so the two operators can be combined as follows:

```
notes /= 20;
```

```
note %= 20;
```

9/15/06

CS150 Introduction to Computer Science 1

3

Examples of Combined Assignments

<i>Operator</i>	<i>Example Usage</i>	<i>Equivalent To</i>
<code>+=</code>	<code>x += 5;</code>	<code>x = x + 5;</code>
<code>-=</code>	<code>y -= 2;</code>	<code>y = y - 2;</code>
<code>*=</code>	<code>z *= 10;</code>	<code>z = z * 10;</code>
<code>/=</code>	<code>a /= b;</code>	<code>a = a / b;</code>
<code>%=</code>	<code>c %= 3;</code>	<code>c = c % 3;</code>

9/15/06

CS150 Introduction to Computer Science 1

4

8.1 Combined Assignments

- Combined assignments can be combined with arithmetic operators

```
y -= a * 2;
```

```
a /= b + c;
```

```
c %= d - 3;
```

- What is the long form of these statements?

9/15/06

CS150 Introduction to Computer Science 1

5

8.2 What is the Output?

```
int unus, duo, tres;
```

```
unus = duo = tres = 5;
```

```
unus += 4;
```

```
duo *= 2;
```

```
tres -= 4;
```

```
unus /= 3;
```

```
duo += tres;
```

```
cout << unus << endl;
```

```
cout << duo << endl;
```

```
cout << tres << endl;
```

9/15/06

6

getline (3.9)

- What happens when the user types their first and last name for the following code segment?

```
string name;  
cout << "Enter your name: ";  
cin >> name;
```

getline

- `cin` passes over and ignores leading whitespaces, but will stop reading once it gets to the first whitespace character after the string
- Solution?
 - Use `getline` function

getline

```
string name;  
cout << "Enter your name: ";  
getline(cin, name);
```

getline

- Syntax for getline

```
getline(cin, inputLine);
```

- Where
 - `cin` is the input stream
 - `inputLine` is the variable where the string will be stored

9/15/06

CS150 Introduction to Computer Science 1

10

cin.get()

- Used to read one character from the keyboard at a time
- Also reads new lines, spaces, and tabs as a character
 - `'\n'`: new line
 - `'\t'`: tab
 - `' '`: space

9/15/06

CS150 Introduction to Computer Science 1

11

Example

```
char ch;  
cout << "This program has paused."  
cout << "Press Enter to continue."  
cin.get(ch);  
cout << "Thank you!" << endl;
```

12

Relational Operators (4.1)

- So far, we can Input, Output and Calculate
- How can we explore relationships between data?
 - Is your grade greater than 90%?
 - Is it hotter or colder today than yesterday?
 - Do I have enough US dollars to get 100 Euros?

9/15/06

CS150 Introduction to Computer Science 1

13

Relational Operators, Explained!

<i>Operator</i>	<i>Meaning</i>
>	Greater than
<	Less than
>=	Greater than or equal to
<=	Less than or equal to
==	Equal to
!=	Not equal to

- All are binary operators
- Left to right associativity

9/15/06

CS150 Introduction to Computer Science 1

14

Relational Expression

- An expression is a statement that has **value**
 - Relational expression: an expression that uses a Relational Operator
 - its value is a **Boolean value** (True or False)
- ```
int x = 9, y = 42;
```
- `x > y`
  - `y == x // y = x; is the assignment operator`
  - `x <= (x * y + 99)`

## Precedence (page 1125)

| Precedence Operators (Highest to Lowest) |  |
|------------------------------------------|--|
| (unary negation) -                       |  |
| * / %                                    |  |
| Arithmetic Operators                     |  |
| + -                                      |  |
| Relational Operators                     |  |
| > >= < <=                                |  |
| == !=                                    |  |
| Assignment Operators                     |  |
| = += -= *= /= %=                         |  |

16

---

---

---

---

---

---

---

---

## 8.3 Practice

- What is the value of the following Relational Expressions?

```
int x = 99, y = 42;
```

- `x > y`
- `y <= x`
- `y != x`
- `x == (x + 1)`
- `y == y + 1`

17

---

---

---

---

---

---

---

---

## Boolean value (True or False)

- How does the computer represent True and False?
- New data type: `bool`

```
bool tValue = true; // 1
bool fValue = false; // 0
```

9/15/06

CS150 Introduction to Computer Science 1

18

---

---

---

---

---

---

---

---

## 8.4 Practice

```
bool value;
int x = 5, y = 10;
value = x > y; // value = ??
value = x == y; // value = ??
value = x == y - 5; // value = ??

// what does this output look like?
cout << "Value is: " << value;
```

9/15/06

CS150 Introduction to Computer Science 1

19

---

---

---

---

---

---

---

---

## The `if` Statement (4.2)

- We execute each statement in our program in order `int x=5, y=10;`
- What `if` we only want to execute a statement sometimes? `if(x > y)`  
`{`
- The `if` Statement! `// do stuff`  
`}`

9/15/06

CS150 Introduction to Computer Science 1

20

---

---

---

---

---

---

---

---

## Formally defined

```
if(expression)
{
 statement 1;
 statement 2;
 . . .
 statement n;
}
```

Just like a **function**, start at the top and execute in order to the bottom

- What is an expression?

9/15/06

CS150 Introduction to Computer Science 1

21

---

---

---

---

---

---

---

---

## 8.5 Practice

```
int x = 5, y = 10;
bool value = x > y;

if (value)
{
 cout << "value is True" << endl;
}
if (x < y)
{
 cout << x << " < " << y;
 cout << " is true" << endl;
}
```

9/15/06

CS150 Introduction to Computer Science 1

22

---

---

---

---

---

---

---

---

## Coding Standards

```
if(expression)
{
 statement 1;
}
```

If you only have ONE statement in the body of the if, the { } are optional in C++.

➔ For this class, the { } must **ALWAYS** be used. Not using { } will result in a loss of style points.

```
if(expression)
statement 1;
```

The { } must also be on their own line.

Why?

9/15/06

CS150 Introduction to Computer Science 1

23

---

---

---

---

---

---

---

---

## 8.6 More on Truth

- Expressions that evaluate to non-zero are considered **true**

```
int x = 5, y = 0;
if (x + y)
{ // This will be executed
 cout << "x + y is True" << endl;
}
if (y)
{ // This will NOT be executed
 cout << "y is True" << endl;
}
```
