

# Arrays

Chapter 8  
page 471

---

---

---

---

---

---

---

---

## Arrays (8.1)

- One variable that can store a *group of values of the same type*
- Storing a number of related values
  - all grades for one student
  - all temperatures for one month
  - hours worked for each day

---

---

---

---

---

---

---

---

## Arrays

```
int age = 42;
int ages[3];
ages[0] = 17;
ages[1] = 22;
ages[2] = 21; // variable_name [ index ]
```

---

---

---

---

---

---

---

---

## When would I use this?

- Read in 5 test scores from the user. Calculate the average test score and print out the scores in reverse order.

```
89
90
84
90
100
Average: 90.6
```

You could do this with 5 integers. But what about 100 test scores? Or 1000?

---

---

---

---

---

---

---

---

## Declaring an Array

- The size of the array must be a *literal* or a `const int`.

```
int size = 99;
const int constSize = 1024;

string names[3];           // literal
double tempatures[size];  // illegal!
int tests[constSize];     // const int
```

- When the code is compiled, the exact size of the array must be known

---

---

---

---

---

---

---

---

## Using arrays (8.2)

- The first element in the array is the 0<sup>th</sup> element!
- You can use a single element of an array just like any other variable

- The *index* is just an `int`
- Loops are often used to access every element in an array

```
int y, x = 3;
int tests[10];

tests[0] = 2;
tests[x] = 4;
y = tests[0] + 9;
```

---

---

---

---

---

---

---

---

## Practice

- Declare an array to hold the height, in inches, of six trees.
- Set the height of the trees as:
  - 32 inches
  - 45 inches
  - 99 inches
  - 120 inches
  - 500 inches
  - 600 inches

7

---

---

---

---

---

---

---

---

## Practice (8.3)

- Write a snippet of code to print to the screen every value in this array:

```
const int arraySize = 4;
int vals[arraySize];
vals[0] = 1;
vals[1] = 2;
vals[2] = 4;
vals[3] = 8;
```

10/22/08

CS150 Introduction to Computer Science 1

8

---

---

---

---

---

---

---

---

## Practice

- Write a snippet of code to print to the screen the sum and average of the values in this array:

```
const int arraySize = 4;
int vals[arraySize];
vals[0] = 1;
vals[1] = 2;
vals[2] = 4;
vals[3] = 8;
```

9

---

---

---

---

---

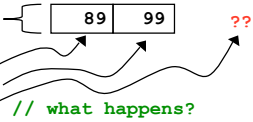

---

---

---

## Danger! Danger! (p 479)

```
int tests[2];  
tests[0] = 89;  
tests[1] = 99;  
tests[4] = 42; // what happens?
```

- C++ does *not* check to make sure the index falls within the array
  - no bounds checking
  - this will cause unpredictable results!

10

---

---

---

---

---

---

---

---

## Initialization (8.4)

- How do you set the initial values for the array elements?
- What is the equivalent of:

```
int value = 2;  
int tests[2] =  
string names[3] =
```
- Initialize just a few values:

```
int value[4] =
```

11

---

---

---

---

---

---

---

---

## Implicit array sizing (p 486)

- Set the size of the array by initializing it
- You *must* either specify a size or initialize the array

```
string names[] =
```

```
char letters[] =
```

---

---

---

---

---

---

---

---

## Using Arrays (8.6)

- Write code that will use arrays to store the names the months and the number of days in each month (assume no leap year!). Print the following to the screen:

```
January 31
February 28
March 31
April 30
May 31
June 30
July 31
August 31
September 30
October 31
November 30
December 31
```

---

---

---

---

---

---

---

---

## Two dimensional arrays (8.9)

- A grid of data!

```
int testScores[2][3];
```

```
testScores[0][0] = 99;
testScores[0][1] = 80;
testScores[0][2] = 88;
testScores[1][0] = 89;
testScores[1][1] = 77;
testScores[1][2] = 85;
```

14

---

---

---

---

---

---

---

---

## Why use 2D arrays?

- Hold the scores for each student in one array.

```
const int BOB = 0;
const int ALICE = 1;
const int MIDTERM1 = 0;
const int MIDTERM2 = 1;
const int FINAL = 2;
int testScores[2][3] = { {0, 0, 0},
                        {0, 0, 0} };
testScores[BOB][MIDTERM1] = 99;
testScores[ALICE][FINAL] = 85;
```

- Which values are we setting above?
- How do we set Alice's Midterm2 score?
- What is stored in `testScores[0][1]` ?

15

---

---

---

---

---

---

---

---

## Practice

- Using the array below, calculate:
  - the average score on each assignment
  - the average score for each student
  - assume the array already contains data

```
const int numberOfStudents = 100;
const int numberOfAssignments = 4;

int testScores[numberOfStudents][numberOfAssignments];
```

16

---

---

---

---

---

---

---

---

## A 2D array in memory

- The 2D array laid out by rows in memory

```
int testScores[2][3] = { {99, 80, 88},
                        {89, 77, 85}};
```

This is called **row major order**. Some languages use **column major order**.

---

---

---

---

---

---

---

---

## N-Dimensional Arrays (8.10)

```
// cost of seats in a theatre
//
// 4 sections, each section has
// 20 rows with 30 seats each.

double seats[4][20][30];

seats[0][0][0] = 100.00;
seats[2][0][0] = seats[1][0][0] / 2;
seats[3][19][25] = 10.00;

// we can have as many dimensions as
// necessary in an array
```
