

CS150 Intro to CS I

Fall 2012

Chapter 6

Functions

- Reading: pp. 301-325
- Good Problems to Work: pp. 323 [6.5, 6.6, 6.7, 6.8, 6.10]

Function

- “A collection of statements that perform a specific task”
 - Functions can be accessed at any point in the code through a *function call*
 - Functions can optionally *return* a value
 - Built-in functions already exist

```
#include <cmath>  
cout << pow (2.0, 3.0); // 2.0 raised to 3.0
```

Function

- Functions
 - 1. are a way of building *modules* in your program
 - 2. encapsulate some calculation
 - 3. result in less repetitive code
 - 4. have a singular theme

Writing Functions

- Suppose we want to write a function **max** that returns the maximum value of two double values.
- What would a call to the function look like?

maximum function

```
Function Name  
Return Type  
double max (double v1, double v2)  
{  
    double maxValue;  
    if (v1 > v2)  
    {  
        maxValue = v1;  
    }  
    else  
    {  
        maxValue = v2;  
    }  
    return maxValue;  
}
```

Parameter List

Function Body

Function calls

```
int main()
{
    double value1, value2, x = 1.5, y = 1.51;

    // must match data types & parameters
    value1 = max(4.2, 2.4);
    value2 = max(x, y);

    cout << value1 << " " << value2
        << max (-1.0, -2.0);

    return EXIT_SUCCESS;
}
```

Compiling Functions

Method 1

```
// Function prototype (or function declaration)
double max (double v1, double v2);

int main ()
{
    cout << max (4.2, 2.4);
    return EXIT_SUCCESS;
}
// Function definition
double max (double v1, double v2)
{
    . . .
    return maxValue;
}
```

Compiling Functions

Method 2

```
// Function definition
double max (double v1, double v2)
{
    . . .
    return maxValue;
}

int main ()
{
    cout << max (4.2, 2.4);
    return EXIT_SUCCESS;
}
```

Functions

- You are to use method 1 for your programming assignment solutions.
- A function is a group of statements intended to perform a specific task (not specific tasks)
- The function is accessed through a function call
- A function can optionally return a value

Practice

- Write a function **factorial** ($N! = N * (N-1) * \dots * 2 * 1$) to calculate the factorial of a given integer.
- Write some C++ statement to use the function to print 4!

void Functions

- Not all functions need to produce a value

```
void printDayOfWeek (int day)
{
    if ( SUNDAY == day )
    {
        cout << " Sunday ";
    }
    else if (MONDAY == day )
    {
        cout << " Monday ";
    }
    . .
    return; // no return value!
}
```

Practice

- Write a function that will calculate the average of three integers and print the result to the screen.
 - What parameters do you need?
 - What should the return type be?
- Write some C++ statements to call this function to determine the average of three integers given by the user.

Your Favorite!!!!

Commenting a function definition

```
*****  
Function: maximum  
  
Description: finds the maximum value of two values  
  
Parameters: value1 - first value of the pair  
            value2 - second value of the pair  
  
Returned: the maximum value  
*****  
  
double maximum (double value1, double value2)
```

Practice

- Write a function **charFlip** that flips the case of a letter. When an upper case letter is given, return the lower case version. When a lower case letter is given, return the upper case version.
- If a punctuation or numeric character is given, just return that character.
 - What parameters do you need?
 - What should the return type be?

Passing Arguments

- What is a function argument?
 - What is a function parameter?
-
- A copy of the argument is made in the parameter
 - If a parameter is changed in the function, is that reflected in main?

What will happen?

-
- What are the arguments? parameters?

```
void swap (int value1, int value2)
{
    int tmp = value1;

    value1 = value2;
    value2 = tmp;
    cout << value1 << " " << value2 << endl;
    return;
}

int main()
{
    int x = 9, y = 10;
    swap(x, y);
    cout << x << " --- " << y << endl;
    return EXIT_SUCCESS;
}
```
