

## Structs and Classes

2/11/05

CS250 Introduction to Computer Science II

1

## Arrays of Pointers

- What do you make of the following declaration?

```
char *cardSuits[4] = {"Clubs", "Diamonds",  
                    "Hearts", "Spades"};
```

- What gets output in each of the following cases?

```
cout << cardSuits[1] << endl;  
cout << *cardSuits[1] << endl;
```

2/11/05

CS250 Introduction to Computer Science II

2

## Arrays of Pointers

- Let's look at an example where arrays of pointers are used
  - <http://zeus.cs.pacificu.edu/shereen/cs250/Lectures/05card.cpp>
- This example also serves as a reminder of how to generate random numbers

2/11/05

CS250 Introduction to Computer Science II

3

## String Functions

- Let's take a look at the string functions on pp. 363

2/11/05

CS250 Introduction to Computer Science II

4

## Review of structs

```
struct Person  
{  
    char nameStr[20];  
    char ssNum[9];  
    int age;  
};
```

- What do each of the following declarations mean?  
`Person personStruct;`  
`Person personArray[5];`  
`Person *pPerson = &personStruct;`  
`Person &personRef = personStruct;`

2/11/05

CS250 Introduction to Computer Science II

5

## References in C++

- `Person &personRef = personStruct;`
- A reference is like a constant pointer that is automatically dereferenced

```
int x = 0;  
int &a = x;  
cout << x << a << endl;  
a++;  
cout << x << a << endl;
```

2/11/05

CS250 Introduction to Computer Science II

6

## Rules for References

- A reference must be initialized when it is created
- Once a reference is initialized to an object, it cannot be changed to refer to another object
- You cannot have NULL references

2/11/05

CS250 Introduction to Computer Science II

7

## Accessing Structure Members

- How do we access structure members?
- How can I initialize the contents of `personStruct` using the object itself, the pointer, and the reference?

2/11/05

CS250 Introduction to Computer Science II

8

## Classes

- The reserved word `class` is used to create the complex `structure`
- Classes differ from structures in that:
  - They don't just combine simple data types into one object
  - They also describe how that data can be manipulated

2/11/05

CS250 Introduction to Computer Science II

9

## More on Objects

- Object-oriented programming hides the details of objects from objects of other types
- When an object needs information from another object or needs another object to perform a task, it sends a message to the object requesting what it needs
- As a result, object-oriented programs can be written more generically than structured programs
- Usually, making changes to the object-oriented programs is easier than changing structured programs

2/11/05

CS250 Introduction to Computer Science II

10

## In Summary

- A `class` is like a `struct` but much more
- Whereas `structs` can contain simple data types, `classes` contain both *data types* and *functions* that manipulate the class data

2/11/05

CS250 Introduction to Computer Science II

11

## A C++ Example

- Enough of theory!
- Let's have a look at a real example.
- We will create a `class Person` that will:
  - Store information about person
  - Store functions to manipulate this information

2/11/05

CS250 Introduction to Computer Science II

12

## The Person Class

```
class Person
{
public:
    int age;
    int returnAge();
    int returnBirthYear();
};

int main()
{
    Person person;
    person.age = 28;
    cout << "person is: " << person.returnAge();
    cout << "person was born in: "
        << person.returnBirthYear();
    return 0;
}
```

2/11/05

CS250 Introduction to Computer Science II

13

## The Person Class

```
int Person::returnAge()
{
    return age;
}

int Person::returnBirthYear()
{
    return 2003 - age;
}
```

2/11/05

CS250 Introduction to Computer Science II

14

## Private & Public

- Class data members and member functions can be either private or public
- Private data members and member functions can only be accessed within that class
- Public data members and member functions can be accessed from outside of that class

2/11/05

CS250 Introduction to Computer Science II

15

## Example Using Private & Public

```
class Person
{
private:
    int age;
public:
    void setAge(int);
    int returnAge();
    int returnBirthYear();
};

int main()
{
    Person person;
    person.setAge(28);
    cout << "person is: " << person.returnAge() << endl;
    cout << "person was born in: "
        << person.returnBirthYear();
    return 0;
}
```

Because age is a private data member, we can't use person.age = 28 here.  
Instead, we need to create a new function in the class to set the age.

2/11/05

CS250 Introduction to Computer Science II

16

## Continued

```
void Person::setAge(int newAge)
{
    age = newAge;
}
```

2/11/05

CS250 Introduction to Computer Science II

17

## Another Example

- Let's look at example 6.3 in the book
