---

---

---

---

---

## Destructors (7.16)

---

- The opposite of constructors
- Have the same name as the class, with a ~ in front of it
- Called whenever an object is destroyed
  - It is out of scope. For example, if it was a local variable in a function and the function has completed
- A destructor has no arguments and or return value
- Only one destructor allowed!
- No need for us to explicitly declare a destructor

2/23/07

CS250 Introduction to Computer Science II

2

---

---

---

---

---

---

---

---

## Example

---

```
class Test
{
    private:
        int id;
    public:
        Test(int);
        ~Test();
};

Test::Test(int i)
{
    id = i;
    cout << "constructor for " << id << " is called\n";
}

Test::~Test()
{
    cout << "destructor for " << id << " is called\n";
}
```

3

---

---

---

---

---

---

---

---

## What is the Output?

```
void funct();

int main()
{
    Test cTest1(1);
    funct();
    Test cTest3(3);

    return 0;
}

void funct()
{
    Test cTest2(2);
}
```

---

---

---

---

---

---

---

---

## Set and Get Functions

- The principle of least privilege says that we should only provide outside members with access to data that is absolutely necessary
- Data members should therefore be set to private
- To modify and get access to that data, specific member functions need to be provided
- These are the Set and Get functions

2/23/07

CS250 Introduction to Computer Science II

5

---

---

---

---

---

---

---

---

## Set and Get Functions

- The functions don't need to be called set or get, but it has become commonplace to do this
- In the time class we could have the following set functions:
  - `void setTime(int, int, int);`
  - `void setHour(int);`
  - `void setMinute(int);`
  - `void setSecond(int);`

2/23/07

CS250 Introduction to Computer Science II

6

---

---

---

---

---

---

---

---

## Get Functions

- For the Time class we would have the following get functions:

```
int getHour();  
int getMinute();  
int getSecond();  
Time cTest4(9, 25, 30);  
Time cTest5(45, 90, 72);
```

7

---

---

---

---

---

---

---

---

## References to Private Data

- Although we may have declared the data inside of a class as private, there is a way to manipulate it directly (not use a member function)
- It is important that we are aware of this so that we can avoid it in the future

2/23/07

CS250 Introduction to Computer Science II

8

---

---

---

---

---

---

---

---

## Example

```
class Test  
{  
private:  
int id;  
public:  
int &setId(int);  
int getId();  
};  
  
int& Test::setId(int newId)  
{  
id = (newId >= 0 && newId <=10)? newId : 0;  
return id;  
}  
  
int Test::getId()  
{  
return id;  
}
```

2/23/07

CS250 Introduction to Computer Science II

9

---

---

---

---

---

---

---

---

## What is the Output?

```
int main()
{
    Test cTest1;

    int &rTestRef = cTest1.setId(5);

    cout << "Id is: " << cTest1.getId() << endl;

    rTestRef = 34;

    cout << "Id is: " << cTest1.getId() << endl;

    cTest1.setId(4) = 52;

    cout << "Id is: " << cTest1.getId() << endl;

    return 0;
}
```

2/23/07

10

---

---

---

---

---

---

---

---

## Default Memberwise Assignment

- It is possible to assign an object to another object of the same type
- This will assign every data member in the first object to the value of the equivalent data member in the second object

2/23/07

CS250 Introduction to Computer Science II

11

---

---

---

---

---

---

---

---

## Example

```
Time cTest1(9, 25, 32);
```

```
Time cTest2;
```

```
cTest2 = cTest1;
```

```
cTest2.printStandard();
```

- Let's illustrate this further with another example
