GENERIC PROGRAMMING

C++ has Templates

- C has void* and function pointers

- How do we write a Linked List that accepts **any** data type?

- How do we write a Linked List that accepts **any** data type and keeps the list in **sorted** order?

- How do we apply the same function to every element in a list? Print?

Sorting Integers

```c
void bubble1 (int *pArray, int count)
{
  bool bExchange = true;
  int indx;
  int temp;
  while (bExchange)
  {
    bExchange = false;

    for (indx = 0; indx < count - 1; indx++)
    {
      if (*(pArray + indx) > *(pArray + indx + 1))
      {
        temp = *(pArray + indx);
        *(pArray + indx) = *(pArray + indx + 1);
        *(pArray + indx + 1) = temp;
        bExchange = true;
      }
    }
  }
}
```

Generic Sorting

- How do we make the previous sorting function generic?
  - void bubble (void *arry, int count);
  - void bubble (void *arry, int count, int elementsize);

- Given b) we can calculate the address of an arbitrary element of arry[k] as follows:

  ```
  (void *) ((char *) arry + k * elementsize)
  ```

- Address arithmetic cannot be performed on type void *

Compare

- If we insert two ints, how do we compare them?

- How do we compare two void* items?
  - no data type information

```
#include <string.h>
int memcmp(void* ptr, void*  ptr2, size_t size);

int memcpy(void* dest, void* src, size_t size);
```

size_t

- Look in a C Eclipse Project | Includes | /usr/lib64/gcc/x86_64-suse-linux/4.5/include | stddef.h

- line 208

```
#define __SIZE_TYPE__ long unsigned int

typedef __SIZE_TYPE__ size_t;
```

Generic Sort

```c
void bubble2 (void *pArray, int count, int elementSize)
{
  bool bExchange = true;
  int indx;
  void *pTemp = malloc (elementSize);
  while (bExchange)
  {
    bExchange = false;
    for (indx = 0; indx < count - 1; indx++)
    {
      if (memcmp((void *)((char *) pArray + indx * elementSize),
                 ((void *)((char *) pArray + (indx + 1) * elementSize)),
                 elementSize) > 0)
      {
        // Exchange code here
        bExchange = true;
      }
    }
  }
  free (pTemp);
}
```

Generic Sort Driver

```c
int main ()
{
  int numbersInt[] = {5, 4, 3, 2, 1};
  char numbersChar[] = {'E', 'D', 'C', 'B', 'A'};
  float numbersFloat[] = {5.0, 4.0, 3.0, 2.0, 1.0};
  int i;

  bubble1 (numbersInt, 5);
  bubble2 (numbersChar, 5, sizeof (char));
  bubble2 (numbersFloat, 5, sizeof (float));

  for (i = 0; i < 5; i++)
  {
   printf("%d\n", numbersInt[i]);
  }
  for (i = 0; i < 5; i++)
  {
   printf("%c\n", numbersChar[i]);
  }
  for (i = 0; i < 5; i++)
  {
   printf("%f\n", numbersFloat[i]);
  }

  return 0;
}
```

Generic Sort Results

```
Results

   1
   2
   3
   4
   5
   A
   B
   C
   D
   E
   2.000000
   3.000000
   1.000000
   4.000000
   5.000000
Press any key to continue
```

Why do you think the floating point numbers are not sorted correctly?

Function Pointers

- Since a pointer is just an address, we can have pointers to functions!

- A function can be called using this address

- Function pointers can be passed as arguments to other functions or return from functions

- Define the function pointer
  - `returnType (*name)(paramType ...)`

Above main

```
int (*foo) (int);

int negate (int x)
{
      return -x;
}

int square (int x)
{
      return x * x;
}
```

Call a Function Using the Pointer

```
foo = &negate;
printf ("\nNegative of 5 is %d\n", (*foo)
(5));

foo = &square;
printf ("\nSquare of 5 is %d\n", (*foo) (5));
```

Passing Functions as Arguments

```c
// Step 1: Define the prototype of the compare function

typedef int (*cmpFnT) (const void *p1, const void *p2);

// Step 2: Implement each compare function

int IntCmpFn (const void *p1, const void *p2)
{
  int v1, v2;

  v1 = *((int *) p1);
  v2 = *((int *) p2);

  if (v1 == v2)
  {
    return 0;
  }
  return ((v1 < v2) ? -1 : 1);
}
```

Passing Functions as Arguments

```
int FloatCmpFn (const void *p1, const void *p2)
{
  float v1, v2;

  v1 = *((float *) p1);
  v2 = *((float *) p2);

  if (v1 == v2)
  {
    return 0;
  }
  return ((v1 < v2) ? -1 : 1);
}
```

Passing Functions as Arguments

```
// Step 3: Implement the generic function (e.g. sorting function)

void bubble3 (void *pArray, int count, int elementSize, cmpFnT cmpFn)
{
  int xchg = false;
  int index = 0;
  void *pTemp = (void *) malloc (elementSize);

  while (!xchg)
  {
    while ((index < count - 1))
    {
      if (cmpFn ((pArray + (index * elementSize)),
          (pArray + (index + 1) * elementSize)) > 0)
      {
        // swap elements .... you write the code

        xchg = true;
      }
      index++;
    }
    if (!xchg)
    {
      return;
    }
    index = 0;
    xchg = false;
  }
  free (pTemp);
}
```

Passing Functions as Arguments

```c
// Step 4: Write driver to test

int main ()
{
  int a[] = {5,4,3,2,1};
  float b[] = {5,4,3,2,1};
  int i;

  bubble (a, 5, sizeof (int), IntCmpFn);
  bubble (b, 5, sizeof (float), FloatCmpFn);

  return 0;
}
```
