

Loops

Sections 5.1, 5.6

Increment and Decrement Operators (5.1)

- C++ provides a shortcut to increment or decrement a variable by 1

```
int x = 99, y = 90;
```

```
x++; // this is equivalent to x += 1
```

```
x--; // this is equivalent to x -= 1
```

In a Loop

- Often, this is used to increment a loop counter

```
int x = 1;
while( x < 5 ){
    cout << " x : " << x << endl;
    x++; // increment
}
```

Examples

- This can be used in an expression:

`y = x++ + 9;`

What does this mean?

- This can also be used in a conditional

`(x-- > 9)`

What does this mean?

Practice

- Write one statement of code to do each of the following:

```
int x =0, y=1;
```

- Add $x + 9$ to y and increment x by 1
- Add $x * 4$ to y and increment x by 1
- Add $y - 13$ to x and decrement y by 1

Prefix vs Postfix

- `++x` is *prefix*
 - The `x += 1` happens *before* the expression is evaluated
- `x++` is *postfix*
 - the `x += 1` happens *after* the expression is evaluated

```
int y=0, x=0, z=0;  
x = y++;  
y = ++z;  
z = x ++ + 1;
```

Examples

```
int x = 0, y = 0;
```

```
x = y++ * 2;
```

```
y = ++x / 2;
```

```
x = x++ + 1;
```

```
x = ++x + 1;
```

```
y = (y+ x++) * 2;
```

```
x = y++ + ++x;
```

Practice

- Write a single C++ statement to do each of the following:
`int y = 0, x = 0, z = 0;`
- Decrement x by 1 then add $2x$ to y
- Add $2y$ to x then increment y by 1
- Subtract $9x - 1$ from y then decrement x by 1
- Increment y by 1 then add $8 - 2y$ to x
- Increment x and y each by 1 then add $x + y$ to z

for loops (5.6)

- 3 main steps for loops:
 - Initialize, Test, Update
- `for` loops provide a concise way to do this

```
// initialize      test      update
for (count = 0; count < 5; count++)
{
    cout << count << endl;
}
```

For vs While

- This for loop

```
for (count = 0; count < 5; count++)  
{  
    cout << count << endl;  
}
```

- is equivalent to

```
count = 0;  
while (count < 5)  
{  
    cout << count << endl;  
    count ++;          // update happens at the end  
}
```

Example

- Write a `for` loop that outputs odd numbers less than 10

Practice

- What does this output?

```
for (i = 5; i < 10; i += 2)
{
    cout << i;
}
```

- Rewrite the for loop as a while loop

Problem

- Write a program that will print the sum of the odd integers between 1 and 50 inclusive. Write one program using a while and the other using a for loop

Practice

- Write a program that computes the factorial of a number. The factorial of a number is given by the formula
- The user will input N
 - $N! = N * (N-1) * \dots * 2 * 1$
 - where $0! = 1$, $1! = 1$, $2! = 2$, $3! = 6$, ...

Localized Declarations

```
for (int i = 0; i < n; i++)
```

```
{
```

```
    cout << i << endl;
```

```
}
```

```
cout << i << endl; // This will cause an error
```

- `i` is declared **ONLY** in the loop
- Convert this to a **while** loop

Potential Pitfalls

- What is the output of the following loop

```
for (count = 0; count < 5; count++)  
{  
    cout << count << endl;  
    count++;  
}
```

Practice

- What is the output of the following loop

```
for (count = 0; count < 10; count += 2)
{
    cout << count << endl;
}
```

Problem

- Write a program that allows the user to enter 20 integers, you should then print out the following:
 - The sum of all integers inputted
 - The average of all integers inputted
 - The largest integer of all integers inputted
