Context Free Grammar

- Another way to represent a language
 - Can represent more languages than FA
 - Produces a “Context Free Language”
 - Pushdown Automata: machine that recognizes a context free language
 - Trivia:
 - First used to describe human languages
 - Now used to parse computer languages (C, C++)
-

Context Free Grammar

- Example

$$A \rightarrow 0A1$$

$$A \rightarrow B$$

$$B \rightarrow \#$$

Variables: A, B (may appear on LHS and RHS)

Terminals: 0, 1, # (only appear on the RHS)

Start variable: Variable on LHS of top rule

Language:

Example:

Example

- $A \rightarrow \quad \rightarrow 00\#11$
 - derivation
 - write $u \rightarrow^* v$ if there is a derivation of the string v from u using the grammar, where u and v are strings of terminals and variables
 - $0A1 \rightarrow^* 00\#11$
 - Parse Tree
-

Exercise

$$R \rightarrow XRX \mid S$$

$$S \rightarrow aTb \mid bTa$$

$$T \rightarrow XTX \mid X \mid \varepsilon$$

$$X \rightarrow a \mid b$$

Variables, terminals of G ?

Start variable?

- True or false? $T \rightarrow^* aba$

Formal Definition

- A context free grammar (CFG) G is a 4-tuple (V, Σ, R, S)
 - V finite set of variables
 - Σ finite set of terminals
 - R set of rules of form:
 - variable (string of variables and terminals)
 - $S \in V$, start variable
 - The language of the grammar is:
 - $L(G) = \{ w \in \Sigma^* \mid S \rightarrow^* w \}$
 - what?

Example

- $L = \{ w \in \{a, b\}^* \mid aa \text{ is a substring} \}$

Find a grammar that generates this language

- Can we write this as a regular expression?

Constructing a CFG from a Language, L

- Requires some thought and creativity, just like building a Finite Automata

- Hints:
 - If possible, break L into pieces $L = L_1 \cup L_2$
 - Create grammar for L1 and L2, $S \rightarrow S_{L_1} \mid S_{L_2}$
 - If L is regular, use regular expression as guide
 - If L is regular, construct DFA then construct CFG:
 - Make variable R_i for each state q_i in DFA
 - Add rule $R_i \rightarrow \epsilon$ for all $q_i \in F$, $R_i \rightarrow aR_z$ if $\delta(q_i, a) = q_z$
 - R_0 is start where q_0 is start of DFA

Example

- Grammar G_2 on page 101
- Show derivation for “a boy sees a flower”
 - Notice how this statement is non-creepy?
- Show the parse tree

Write the Grammar

$$\Sigma = \{0,1\}$$

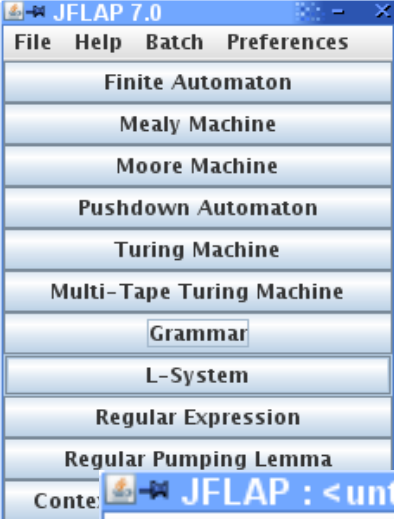

- $\{w \mid w \text{ is a binary number greater than } 4\}$
- $\{w \mid w \text{ is } 1^n 0^n, n \geq 0\}$? $n \geq 1$
- $\{w \mid w \text{ is } 1^n 0^n, n \geq 0, n \text{ is even}\}$
- $\{w \mid w \text{ contains at least three } 1\text{s}\}$
- $\{w \mid w \text{ contains more } 1\text{s than } 0\text{s}\}$
- $\{w \mid |w| \text{ is prime}\}$
- $\{a^i b^j c^k \mid i=j \text{ or } i=k\}$ $\Sigma = \{a,b,c\}$
- $\{w \mid w \text{ is a string of matched } ()\}$ $\Sigma = \{ (,) \}$

Ambiguous Grammar

- $E \rightarrow E + E \mid E \times E \mid E \mid a$
 - Find parse tree for: $a + a \times a$
-

JFLAP

JFLAP appears to want the start symbol to be S

Editor window showing a grammar table:

LHS		RHS
S	→	A
A	→	0A1
A	→	B
B	→	#

Brute Parser window showing the input and parse tree:

Input: 0#1
String accepted! 6 nodes generated.

LHS		RHS
S	→	A
A	→	0A1
A	→	B
B	→	#

Derived 0A1 from A.

Parse Tree Diagram:

```
graph TD; S((S)) --- A1((A)); A1 --- 0((0)); A1 --- A2((A)); A1 --- 1((1));
```

More examples

$$\Sigma = \{0,1\}$$

- $\{w \mid |w| \text{ is odd, middle character is } 0\}$
- $\{w \mid w = xyx, x \in \Sigma, y \in \Sigma^*\}$

- $\{w \mid w = w^R\}$
- complement of $\{w \mid w = 0^n 1^n, n \geq 1\}$
- $\{w \# x \mid w^R \text{ is a substring of } x; w, x \in \Sigma^*\}$
- $\{w \mid w = 0^{n+m} 1^n, n \geq 1, m \geq 1\}$
- $\{w \mid w \text{ contains at least as many } 0\text{s as } 1\text{s}\}$
- $\{w \mid w = 0^{2^n} 1^n, n \geq 1\}$
- $\{w \mid w \text{ contains twice as many } 0\text{s as } 1\text{s}\}$
