# Quick Review

- (CFG) 4-tuple  $(V, \Sigma, R, S)$ 
  - $V$  finite set of variables
  - $\Sigma$  finite set of terminals
  - $R$  set of rules of form:
    - variable  $\rightarrow$  (string of variables and terminals)
  - $S \in V$ , start variable
  - $L(G) = \{ w \in \Sigma^* \mid S \xrightarrow{*} w \}$ 
    - $w$  is in  $\Sigma^*$  and can be derived from  $S$

## Example

$A \rightarrow 0A1$

$A \rightarrow B$

$B \rightarrow \#$

# Chomsky Normal Form

- CNF presents a grammar in a standard, simplified form:
- 

$A \rightarrow BC$

$A \rightarrow a$

$S \rightarrow \varepsilon$

- Where  $A, B, C$  are variables
  - $B$  and  $C$  are not the start variable
- $a$  is a terminal
- The rule  $S \rightarrow \varepsilon$  is allowed so the language can generate the empty string (optional)

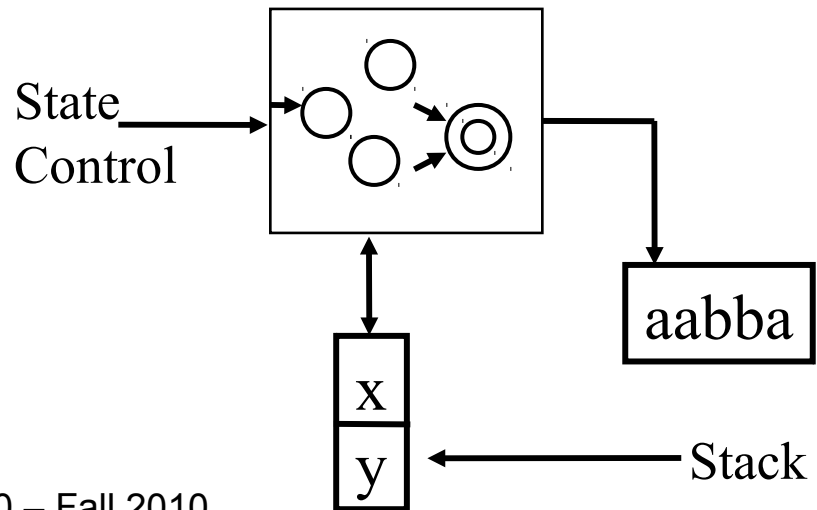

# Pushdown Automata

- Machine to recognize Context Free Language
- Similar to an NFA, but contains a *stack*
  - An FA with memory added (LIFO!)

FA

Pushdown Automata

# Pushdown Automata

- PDA may be deterministic or nondeterministic
  - Not equivalent! (unlike DFA & NFA)
- Define certain (state, input) to push data onto the stack
- Combine input string with stack data for  $\delta$

# Pushdown Automata (Informally)

$S \rightarrow X$

$X \rightarrow ( X ) \mid XX \mid \varepsilon$

---

What language? Regular?

How would you solve this problem using a stack (forget the Pushdown Automata)?

# Formal Definition

- 6-tuple!
  - $Q$ : set of states

---

- $\Sigma$ : input alphabet
- $\Gamma$ : stack alphabet
- $\delta: Q \times \Sigma_\epsilon \times \Gamma_\epsilon \rightarrow P(Q \times \Gamma_\epsilon)$ 
  - input and top of stack to transition
  - Do not read or write from stack:  $\Gamma_\epsilon = \epsilon$
- $q_0 \in Q$ : start state
- $F \subseteq Q$ : set of accept states

# Example (Non-deterministic)

- $\{ 0^* 1^n \mid n \geq 0 \}$

– q1 start state

– \$ special symbol

| Input | 0           |             |               | 1                    |             |             | $\epsilon$  |                      |                |
|-------|-------------|-------------|---------------|----------------------|-------------|-------------|-------------|----------------------|----------------|
| Stack | 0           | \$          | $\epsilon$    | 0                    | \$          | $\epsilon$  | 0           | \$                   | $\epsilon$     |
| q1    | $\emptyset$ | $\emptyset$ | $\emptyset$   | $\emptyset$          | $\emptyset$ | $\emptyset$ | $\emptyset$ | $\emptyset$          | $\{(q2, \$)\}$ |
| q2    | $\emptyset$ | $\emptyset$ | $\{(q2, 0)\}$ | $\{(q3, \epsilon)\}$ | $\emptyset$ | $\emptyset$ | $\emptyset$ | $\emptyset$          | $\emptyset$    |
| q3    | $\emptyset$ | $\emptyset$ | $\emptyset$   | $\{(q3, \epsilon)\}$ | $\emptyset$ | $\emptyset$ | $\emptyset$ | $\{(q3, \epsilon)\}$ | $\emptyset$    |
| q4    | $\emptyset$ | $\emptyset$ | $\emptyset$   | $\emptyset$          | $\emptyset$ | $\emptyset$ | $\emptyset$ | $\emptyset$          | $\emptyset$    |

# Example

- Alternate notation:

$a, b \rightarrow c$   
→

Read  $a$  from input,  
read  $b$  from stack,  
push  $c$  onto stack to  
take this transition

$a = \epsilon$ , read no input  
 $b = \epsilon$ , don't pop  
data from stack  
 $c = \epsilon$ , don't push  
data onto stack

# Practice

- $\{ ww^R \mid w \in \{0, 1\}^* \}$

---

hint: push symbols onto the stack, at each point guess that the middle of the string

has been reached and begin popping from stack
