
Quicksort

Chapter 7

Sorting

- What's the running time for:
 - Insertion Sort
 - Merge Sort
 - Heapsort
- Which of these algorithms sort in place?

Quicksort

- The Basic version of quicksort was invented by C. A. R. Hoare in 1960
- Divide and Conquer algorithm
- In practice, it is the fastest in-place sorting algorithm

Divide and Conquer

- **Divide:** Partition the array into two subarrays around a pivot x such that elements to the left are $\leq x$ and elements to the right are $\geq x$

- **Conquer:** Recursively sort the two subarrays
 - **Combine:** Trivial!
- Good
Partitioning
Subroutine!
- Key?

Quicksort Pseudocode p171

QUICKSORT(A, p, r)

```
Quicksort(A, p, r) // A:Array; p,r: integer indexes
1  if p < r
2      q = Partition(A, p, r);
3      Quicksort(A, p, q-1);
4      Quicksort(A, q+1, r);
```

- What's the call to sort the entire array?

Partitioning the Array p 171

PARTITION(A, p, r)

	<code>Partition(A,p,r) // A:Array; p,r: integer indexes</code>
<code>1</code>	<code>x = A[r]</code>
<code>2</code>	<code>i = p - 1</code>
<code>3</code>	<code>for j = p to r-1</code>
<code>4</code>	<code> if A[j] <= x</code>
<code>5</code>	<code> i = i + 1</code>
<code>6</code>	<code> swap(A[i], A[j])</code>
<code>7</code>	<code>swap (A[i+1], A[r])</code>
<code>8</code>	<code>return i+1</code>

Many partition functions possible. p 179, 185

Correctness of Partition

- During the execution of PARTITION there are four distinct sections of the array:

Example

Example

7
x

Return the
location of pivot

Exercise - Partition the Following

44	75	23	43	55	12	64	77	33	41
-----------	-----------	-----------	-----------	-----------	-----------	-----------	-----------	-----------	-----------

Analysis of Partition

- What is the running time of PARTITION?

	<code>Partition(A,p,r) // A:Array; p,r: integer indexes</code>
1	<code>x = A[r]</code>
2	<code>i = p - 1</code>
3	<code>for j = p to r-1</code>
4	<code> if A[j] <= x</code>
5	<code> i = i + 1</code>
6	<code> swap(A[i], A[j])</code>
7	<code>swap (A[i+1], A[r])</code>
8	<code>return i+1</code>

Quicksort in Action

Exercise

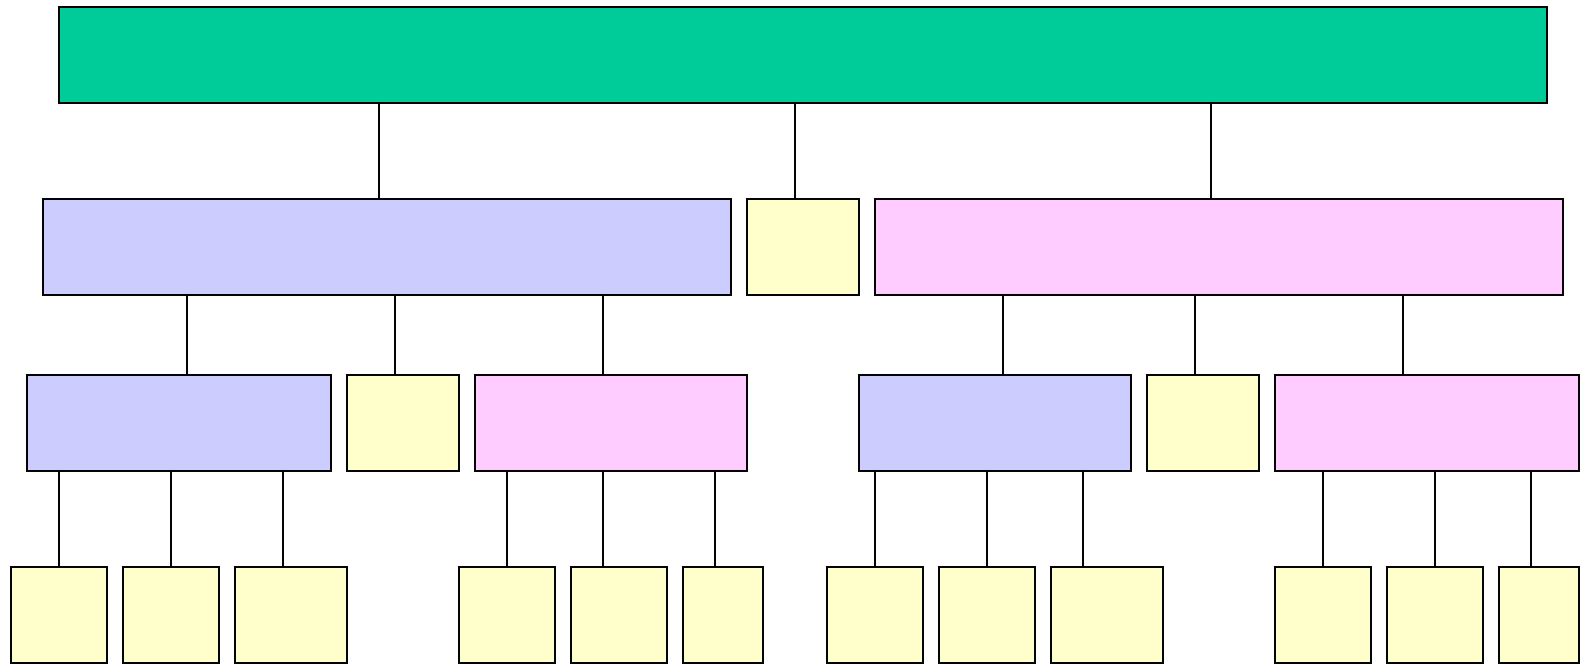

- Sort the following array using quicksort

3	4	2	5	1
---	---	---	---	---

Performance of Quicksort

- What does the performance of quicksort depend on?
- What would give us the best case?

Best Case of Quicksort

Average Case Analysis

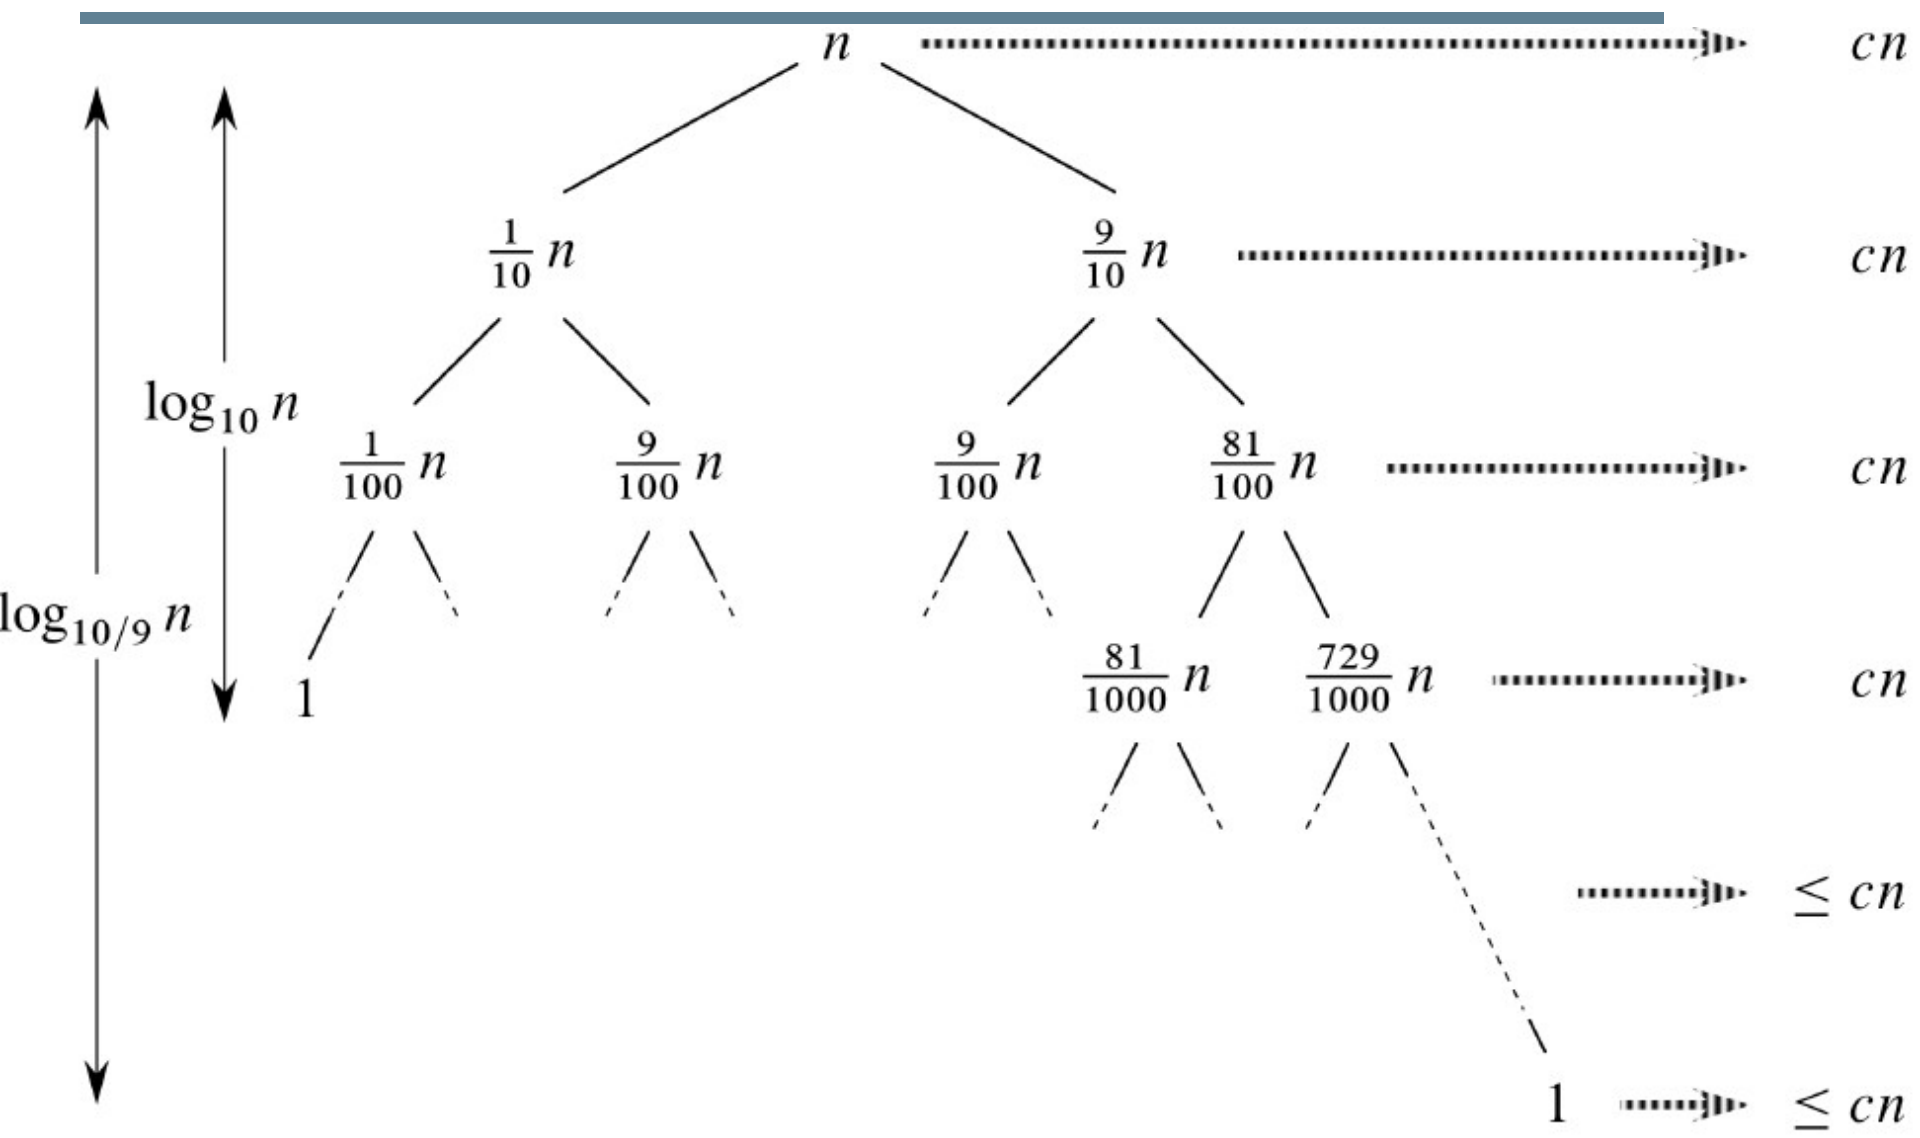

- Let's look at this by intuition
- Running quicksort on a random array is likely to produce a mix of balanced and unbalanced partitions
- It has been shown that 80% of the time partition produces good splits and 20% of the time it produces bad splits

Assume 9-1 split, p 176

- Assume each partition is a 9 to 1 split.
 - constant proportionality
- What is the recurrence?

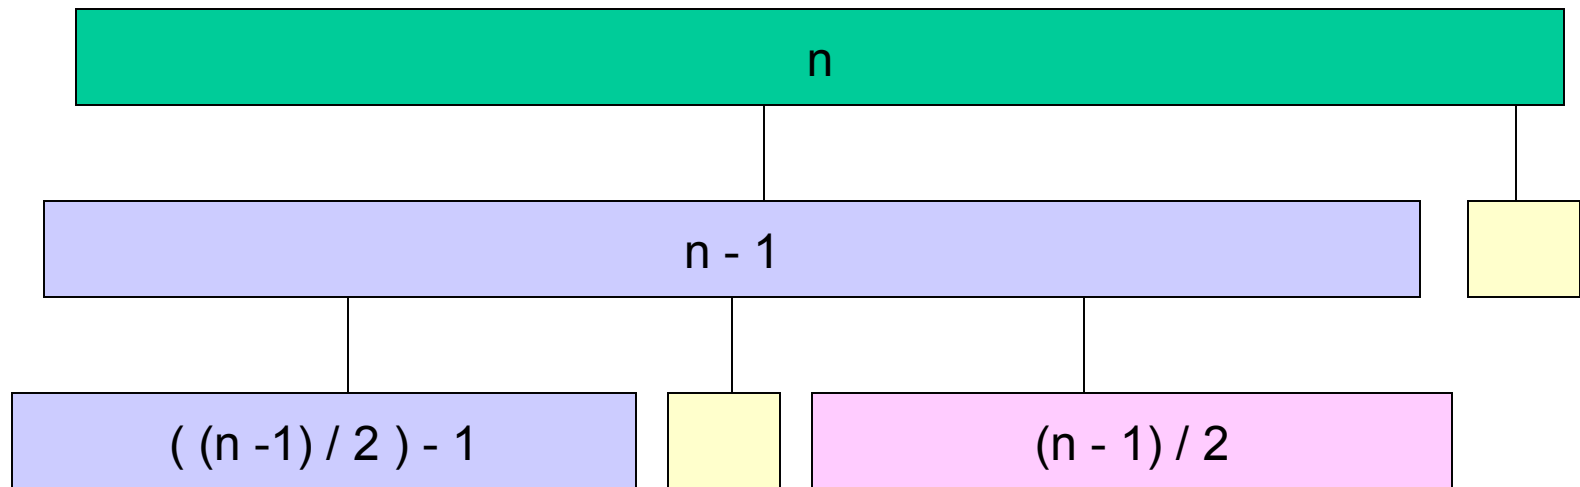

Fig 7.4

What does the recursion tree look like (9-1 split)?

$O(n \lg n)$

Average Case Analysis

- This is really no different than:

- Thus, the $O(n - 1)$ of the bad split can be absorbed into the $O(n)$ of the good split

Average Case Analysis

- The running time of quicksort when alternating good and bad splits is like the running time for good splits alone
- $O(n \lg n)$ but with a slightly larger constant hidden by the O -notation

Random Partition, p 179

	<code>Randomized-Partition(A, p, r)</code>
<code>1</code>	<code>i = RANDOM(p, r)</code>
<code>2</code>	<code>swap (A[r], A[i])</code>
<code>3</code>	<code>return PARTITION(A, p, r)</code>

Hoare Partition, p 185

HoareParition(A,p,r)	
1	x = A[p]
2	i = p - 1
3	j = r + 1
4	while TRUE
5	do
6	j=j-1
7	while(A[j] > x)
8	do
9	i = i+1
10	while(A[i] < x)
11	if (i < j)
12	swap (A[i], A[j])
13	else return j
