

SPSS Regression and Hypothesis Worksheet

Answer the following questions in a Word document. Copy the relevant tables output by **SPSS** into the Word document to justify your answers.

1) Go to the Web Site

<http://www.physics.csbsju.edu/stats/t-test.html> and solve the problem under the heading Paired Data. The data is provided on the website. You will need to determine the best way to get that data into SPSS and how to lay it out correctly.

This problem looks at Cedar-apple rust disease, and if there is a difference in the disease after treatment.

a) What is the NULL hypothesis?

b) Perform the Paired Student's t-test in SPSS.

c) Should we accept or reject the Null Hypothesis? Why?

d) State your conclusion

2) The dean of students wants to see whether there is a significant difference in age between resident students and commuting students. She selected a random sample of 10 students from each group.

The data follows:

Resident Students	Commuter Students
22	18
25	20
27	19
23	18
26	22
28	25
26	24
24	22
25	23
20	18

Null hypothesis: There is no statistically significant difference in the age between resident and commuting students in the above study.

Question: Should we accept the null hypothesis?

3) Consider the following table which shows the number of bushels of wheat produced for the given rainfall amounts:

Rainfall	2.5	3	4.5	7.6	9.5	10.3	in inches
Bushels	37	43	42	46	48	51	of wheat

- Create a scatterplot (scattergram) for this data. You need to correctly set up the data in SPSS and then graph the data correctly by deciding which variable is the dependent variable and which variable is the independent variable.
- What is the dependent variable? Why?
- What is the independent variable? Why?
